High Efficiency Solutions

<u>CAREL</u>

IMPORTANT

CAREL bases the development of its products on decades of experience in HVAC, on the continuous investments in technological innovations to products, procedures and strict quality processes with in-circuit and functional testing on 100% of its products, and on the most innovative production technology available on the market. CAREL and its subsidiaries nonetheless cannot guarantee that all the aspects of the product and the software included with the product respond to the requirements of the final application, despite the product being developed according to start-of-the-art techniques.

The customer (manufacturer, developer or installer of the final equipment) accepts all liability and risk relating to the configuration of the product in order to reach the expected results in relation to the specific final installation and/or equipment. CAREL may, based on specific agreements, act as a consultant for the positive commissioning of the final unit/application, however in no case does it accept liability for the correct operation of the final equipment/system.

The CAREL product is a state-of-the-art product, whose operation is specified in the technical documentation supplied with the product or can be downloaded, even prior to purchase, from the website www.CAREL.com.

Each CAREL product, in relation to its advanced level of technology, requires setup / configuration / programming / commissioning to be able to operate in the best possible way for the specific application. The failure to complete such operations, which are required/indicated in the user manual, may cause the final product to malfunction; CAREL accepts no liability in such cases.

Only qualified personnel may install or carry out technical service on the product. The customer must only use the product in the manner described in the documentation relating to the product.

In addition to observing any further warnings described in this manual, the following warnings must be heeded for all CAREL products:

- Prevent the electronic circuits from getting wet. Rain, humidity and all types of liquids or condensate contain corrosive minerals that may damage the electronic circuits. In any case, the product should be used or stored in environments that comply with the temperature and humidity limits specified in the manual.
- Do not install the device in particularly hot environments. Too high temperatures
 may reduce the life of electronic devices, damage them and deform or melt the
 plastic parts. In any case, the product should be used or stored in environments
 that comply with the temperature and humidity limits specified in the manual.
- Do not attempt to open the device in any way other than described in the manual.
- Do not drop, hit or shake the device, as the internal circuits and mechanisms may be irreparably damaged.
- Do not use corrosive chemicals, solvents or aggressive detergents to clean the device.
- Do not use the product for applications other than those specified in the technical manual.

All of the above suggestions likewise apply to the controllers, serial boards, programming keys or any other accessory in the CAREL product portfolio.

CAREL adopts a policy of continual development. Consequently, CAREL reserves the right to make changes and improvements to any product described in this document without prior warning.

The technical specifications shown in the manual may be changed without prior warning.

The liability of CAREL in relation to its products is specified in the CAREL general contract conditions, available on the website www.CAREL.com and/or by specific agreements with customers; specifically, to the extent where allowed by applicable legislation, in no case will CAREL, its employees or subsidiaries be liable for any lost earnings or sales, losses of data and information, costs of replacement goods or services, damage to things or people, downtime or any direct, indirect, incidental, actual, punitive, exemplary, special or consequential damage of any kind whatsoever, whether contractual, extra-contractual or due to negligence, or any other liabilities deriving from the installation, use or impossibility to use the product, even if CAREL or its subsidiaries are warned of the possibility of such damage.

DISPOSAL

INFORMATION FOR USERS ON THE CORRECT HANDLING OF WASTE ELECTRICAL AND ELECTRONIC EQUIPMENT (WEEE)

In reference to European Union directive 2002/96/EC issued on 27 January 2003 and the related national legislation, please note that:

- WEEE cannot be disposed of as municipal waste and such waste must be collected and disposed of separately;
- the public or private waste collection systems defined by local legislation must be used. In addition, the equipment can be returned to the distributor at the end of its working life when buying new equipment;
- the equipment may contain hazardous substances: the improper use or incorrect disposal of such may have negative effects on human health and on the environment;
- the symbol (crossed-out wheeled bin) shown on the product or on the packaging and on the instruction sheet indicates that the equipment has been introduced onto the market after 13 August 2005 and that it must be disposed of separately;
- 5. in the event of illegal disposal of electrical and electronic waste, the penalties are specified by local waste disposal legislation.

Warranty on the materials: 2 years (from the date of production, excluding consumables).

Approval: the quality and safety of CAREL INDUSTRIES Hqs products are guaranteed by the ISO 9001 certified design and production system.

WARNING: separate as much as possible the probe and digital input signal cables from the cables carrying inductive loads and power cables to avoid possible electromagnetic disturbance.

Never run power cables (including the electrical panel wiring) and signal cables in the same conduits.

Key icone

0	NOTE:	to bring attention to a very important subject; in particular, regarding the practical use of the various functions of the product.
	IMPORTANT:	to bring critical issues regarding the use of the pRack pR300 to the attention of the user.
Ø	TUTORIAL:	some simple examples to accompany the user in configuring the most common settings.

CAREL

1. INTRODUCTION

1.1 Main features

pRack pR300 is the evolution of the pR100 electronic controller. The consolidated software for management of compressor racks is combined with new functions, on a totally upgraded hardware platform. Below are the main functions (new and consolidated) and compressor management features on pRack pR300.

1.1.1 pR300 functionality list

Main features	Direct management via Fieldbus, using either the built-in driver (PRK300D*) or external driver, of one or two valves for the opera- tion of heat exchangers typically used in subcritical systems (CO ₂) Up to 2 suction line and 2 condensing line Scroll, reciprocating, digital scroll and screw compressors management Up to 12 scroll compressors, reciprocating for line Up to 2 screw compressors for line 1, maximum one screw com- pressors line Fino a 2 compressori Bitzer CRII (massimo 1 per linea) Up to 16 fans for line Inverter for suctione and condensing line Generic functions easily configurable (ON/OFF, modulations, alarms, scheduler) Heat recovery
Hardware	S, M, D, L version (based on pRack hardware) External display (pGDE) or built-in display
Compressors	Up to 12 piston compressors per line, a maximum of 4 different sizes Up to 4 alarms per compressor Inverter management, even with modulation inside the dead zone Pump down Control of overheating in suction
Languages	Italian, English, German, French, Spanish, Russian, Portoguese, Swedish
Unit of measure	Temperature: °C, °F Pressure: barg, psig (all pressure values are also converted to temperature) Date format settable between: dd/mm/yy, mm/dd/yy, yy.mm.dd
Control	Proportional band (P, PI) available for compressors and fans Neutral zone available for compressors and fans
Compressor rotation	FIFO LIFO Timed Fixed (the ON/OFF order can be set as required)
Scheduling by calendar	Scheduling available: heating/cooling, 4 daily time bands, 5 special periods (e.g.: closing period), 10 special days (e.g.: holidays) Schedulable functions: set point compensation for compressors and fans, split condenser (heating/cooling only), anti noise, heat recovery, generic functions
Setpoint	Compensation from digital input, from scheduling, floating based on supervisor parameter (compressors) or outside temperature (fans)
Prevent	High pressure, including activation of heat recovery or ChillBooster
Alarms	Automatic and manual management Configurable compressor alarms Double Signal on digital outputs for high or low priority alarms Log from application
Supervisor	Carel
protocol	Modbus®
	Tab. 1.a

1.2 Components and accessories

The pRack pR300 is available in 4 hardware sizes listed in the table (for the detailed description of each size, electrical characteristics and installation, refer to Chapter 2):

Hardware sizes:

Size	Available ana- log inputs	Available digital inputs	Available analog outputs	Available digital outputs
Small	5	8	4	8
Medium	8	14	4	13
Medium + Driver	8	14	4	13
Large	10	18	6	18
				Tab. 1.b

For each size the following versions are available: • with built-in terminal, without terminal

All pRack pR300 models are equipped with:

- integrated RS485 serial interface
- anthracite gray plastic cover
- connector kit
- USB.

pRack pR300 models

Code	Description
PRK300S0F0	pRack pR300 small, USB, no display, BMS/FBUS opto, connector kit.
PRK300S0E0	pRack pR300 small, USB, no display, BMS/FBUS opto, 2 SSR, connector kit,
PRK300M0F0	pRack pR300 medium, USB, no display, BMS/FBUS opto, connector kit,
PRK300M0E0	pRack pR300 medium, USB, no display, BMS/FBUS opto, 2 SSR, connector kit,
PRK300D0F0	pRack pR300 medium, EVD EVO embedded for 2 univ. EXV, USB, no display, BMS/FBUS opto, connector kit,
PRK300D0E0	PRack pR300 medium, EVD EVO embedded for 2 univ. EXV, USB, no display, BMS/FBUS opto, 2 SSR, connector kit,
PRK300L0F0	pRack pR300 large, USB, no display, BMS/FBUS opto, connector kit
PRK300L0E0	pRack pR300 large, USB, no display, BMS/FBUS opto, 6 SSR, connector kit,
PRK300S3F0	pRack pR300 small, USB, display built-in, BMS/FBUS opto, connector kit,
PRK300S3E0	pRack pR300 small, USB, display built-in, BMS/FBUS opto, 2 SSR, connector kit.
PRK300M3F0	PRack pR300 medium, USB, display built-in, BMS/FBUS opto, connector kit,
PRK300M3E0	pRack pR300 medium, USB, display built-in, BMS/FBUS opto, 2 SSR, connector kit
PRK300D3F0	pRack pR300 medium, EVD EVO embedded for 2 univ. exv, USB, display built-in, BMS/FBUS opto, connector kit
PRK300D3E0	pRack pR300 medium, EVD EVO embedded for 2 univ. exv, USB, display built-in, bms/fbus opto, 2 SSR, connector kit
PRK300L3F0	pRack pR300 large, USB, display built-in, BMS/FBUS opto, connector kit
PRK300L3E0	pRack pR300 large, USB, display built-in, BMS/FBUS opto, 6 ssr, connector kit
PRK300S3FK	pRack pR300 small, USB, external display, BMS/FBUS opto, connector kit
PRK300M3FK	pRack pR300 medium, USB, external display, BMS/FBUS opto, connector kit
PRK300D3FK	pRack pR300 medium, EVD EVO embedded for 2 univ. EXV, USB, external display, BMS/FBUS opto, connector kit
PRK300L3FK	pRack pR300 large, USB, external display, BMS/FBUS opto, connector kit

Tab. 1.c

Accessories:

Code	Description
PGDERK0FX0	pGD evolution user terminal for pRack pR300T
CONVONOFF0	Module to convert a
	010 V analog output to an SPDT digital output
PCOS004850	RS485 serial connection board
CVSTDUTLF0	USB/RS485 serial convertor with telephone connector
CVSTDUMOR0	USB/RS485 serial converter with 3-way terminal
PCOSO0AKY0	Smart Key programming key
S90CONN002	Connection cable for terminal 1=0.8m
S90CONN000	Connection cable for terminal 1=1.5m
S90CONN001	Connection cable for terminal 1=3 m
SPKT*R* and	Ratiometric pressure probes 05 Vdc
SPKC00*	
SPK*C*, SPK1*,	Active pressure probes 420 mA
SPK2*, SPK3*	
NTC*	Pressure probe NTC -50T90°C
NTC*HT*	Pressure probe NTC -0T150°C
EVD0000E50	EVD EVO universal driver for Carel valves, RS485/Modbus™
EVDIS00D*0	Display for EVD EVO
E2VCABS*00	EVD-valve connection cable
	Tab. 1 d

Tab. 1.d

1.3 Configuration of the system and configuration of the inputs and outputs

pRack pR300 has the same system, input and output configuration management as the standard pRack pR100. It is available 22 configurations, but it is more ultilised those described in Appendix A.1.

Note: each input/output is completely configurable with the only requirements being those set by the system configuration. For example, the suction pressure probe on line 1 can be arbitrarily configured to any one of the analog inputs in the pLAN control board with address 1 compatible with the type of probe.

Refer Cap. 4, to have more ionformation about selection of configuration system and pre-configuration and see Appendix A.1.

1.3.1 System configurations available

pRack pR300 can manage system configurations with up to 2 suction lines (maximum 12 scroll or piston compressors for lines 1 and 2, maximum 2 screw compressors for line 1 and maximum 1 BitzerCRII compressor per line), up to 2 condenser lines (maximum 16 fans per line). When there are two suction lines, the 2 lines can be managed by the same pRack board or by separate boards. The condenser lines can be managed by the board controls the suction lines or by separate boards, depending on the number of inputs/outputs available. For each suction and condenser line, pRack pR300 can manage a modulating device (inverter, Digital Scroll® compressor, compressor with continuous control or BitzerCRII compressor). pRack pR300 manages up to 1 line with screw compressors, and the board can control up to 2 compressors.

Some examples of managed system configurations are described below, while for the complete list of configurations and its features refer to Appendix A1.

Example 1: 1 suction line with scroll or piston compressors, 1 high pressure line:

Example 2: 2 suction lines on the same board with scroll or piston compressors, 1 high pressure line:

Fig. 1.b

Example 4: 2 suction lines on board (scroll or piston compressors), 2 high pressure lines on the board):

Example 4: 2 suction lines on separate boards (scroll or piston compressors), 2 high pressure lines (on the first suction line board):

Example 5: 2 suction lines on separate boards with scroll or piston compressors, 2 high pressure line on separate boar

Note: if connecting more than one pRack pR300 board in a pLAN, mixed networks cannot be created combining Compact boards and S, M, L boards, while mixed networks are possible using combinations of the latter models only.

Important: all the boards connected to the pLAN must have the same software revision.

2. HARDWARE CHARACTERISTICS AND INSTALLATION

2.2.3 Universal inputs/outputs U...

Analogue inputs, Lmax = 30 m		SMALL	MEDIUM/ BUILT-IN DRIVER/EXTRALARGE	LARGE
(maximum number)	- CAREL NTC probes (-50T90°C; R/T 10 kΩ±1% at 25°C);	5	8	10
	- HT NTC (0T150°C); - PTC (600Ω to 2200Ω)			
	- PT500 (-100T400°C) - PT1000 (-100T400°C)			
	- PT100 probes (-100T200°C)	2	3 (2 on U1U5,	4 (2 on U1U5,
			1 on U6U8)	1 on U6U8, 1 su U9U10)
	- 0 to 1 Vdc/0 to 10 Vdc signals from probes powered by controller	5	6	⁶
	- 0 to 1 Vdc/0 to 10 Vdc signals powered externally	5 5	max tot 8	01 10 01
	- 0 to 20 mA /4 to 20 mA inputs from probes powered by the controller	tot 4 +	6 (max 4 on U1U5, ▷ 3 on U6U8) 뒪	6 (max 4 on U1U5, o 3 on U6U8, 호 2 on U9U10)
	- 0 to 20 mA /4 to 20 mA inputs powered externally	A A	to 7 (max 4 on U1U5, 3 on U6U8)	(max 4 on U1U5, 3 on U6U8, 2 on U9U10)
	- 0 to 5 V signals from ratiometric probes powered by controller	5	6	6
	Input precision: ± 0.3 % f.s.			
	Time constant for each input: 0.5 s			
	Classification of measuring circuits (CEI EN 61010-1): category I			
Digital inputs w/o optical isolation,		SMALL	MEDIUM/ BUILT-IN	LARGE
Lmax = 30 m		_	DRIVER/EXTRALARGE	
(maximum number)	- voltage-free contacts	5	8	10
	- fast digital inputs	max 2	4	6
	type: voltage-free contact		(max 2 on U1U5,	(max 2 on U1U5,
	max current: 10 mA		max 2 on U6U8)	max 2 on U6U8,
	max frequency 2kHz and resolution ±1 Hz			2 on U9U10)

Important:

for active probes powered externally (0 to 1 V, 0 to 10 V, 0 to 20 mA, 4 to 20 mA), to avoid irreparably damaging the controller, implement adequate current protection measures that must ensure < 100 mA;

the ratiometric probes can only be powered by the controller;

• on power-up, the universal inputs/outputs remain shorted to GND for around 500 ms until the end of the configuration procedure.

Analogue outputs w/o optical isolation		SMALL	MEDIUM/ BUILT-IN	LARGE
(maximum number), Lmax = 30 m			DRIVER/EXTRALARGE	
	0 to 10 Vdc (maximum current 2 mA)	5	8	10
	PWM (output 0/3.3 Vdc, maximum current 2 mA, frequency: 2kHz	5	8	10
	asynchronous)			

Tab. 2.f

Power supply to probes and terminals 2.2.4

+Vdc	can be used to power any active probes using the 24/21 Vdc ± 10% (P+5*/P+3*) available at terminal +VDC (J2). The maximum current available is 150 mA, protected against short-circuits.
+5Vref	to power the 0 to 5V ratiometric probes, use the 5 Vdc (\pm 5%) available at terminal +5VREF(J24). The maximum current available is 60 mA.
Vterm	$P+3^{********}: 21 Vdc \pm 10\%; P+5^{*********}: 24 Vdc \pm 10\%$
vienn	Used to power an external terminal as an alternative to the one connected to J10, Pmax = 1.5 W
In a stant if the	length exceeds 10 m use shielded selecution the shield connected to earth in any case, the may length ellowed is 20 m

Important: if the length exceeds 10 m, use shielded cable with the shield connected to earth. In any case, the max length allowed is 30 m.

circuits (CEI EN 61010-1)	Category III: 230 Vac (J8, J19)		
Digital input current draw at 2	24 Vac/Vdc	5 mA	
Digital input current draw at 2	230 Vac	5 mA	
·			Tab. 2.h

Note:

- separate as much as possible the probe and digital input cables from cables to inductive loads and power cables, so as to avoid possible electromagnetic disturbance. Never run power cables (including the electrical panel cables) and signal cables in the same conduits;
- the two 230 Vac or 24 Vac/Vdc inputs on terminals J8 (ID13, ID14) or J19 (ID15, ID16) have the same common pole and therefore both will operate at 230 Vac or 24 Vac/Vdc. There is basic insulation between the two inputs; there is reinforced insulation between the inputs and the rest of the controller;
- ID1...ID8, ID9 to ID12, ID17, ID18 have functional insulation from the rest of the controller;
- for DC voltage inputs (24 Vdc) either the + or the can be connected to common terminal;
- the rating of the external contact connected to the digital inputs must be at least 5 mA.

2.2.6 Analogue outputs Y...

Туре	0 to 10 V optically-isolated on Y1Y6		
Lmax	30 m		
	SMALL, MEDIUM/ BUILT-IN DRIVER	4 Y1Y4, 0 to 10 V	
Maximum number	LARGE	6 Y1Y6, 0 to 10 V	
Power supply	external	24 Vac (+10/-15%) or 28 to 36 Vdc on VG(+), VG0(-)	
Precision	Y1Y6	± 2% full scale	
Resolution	8 bit		
Settling time	Y1Y6	from 1 s (slew rate 10 V/s) to 20 s (slew rate 0.5 V/s) selectable via SW	
Maximum load	1 kΩ (10 mA)		-
	*		Tab. 2.i

- for lengths > 10 m, only use shielded cable, with the shield connected to earth;
- a 0 to 10 Vdc analogue output can be connected in parallel to other outputs of the same type, or alternatively to an external source of voltage. The higher voltage will be considered. Correct operation is not guaranteed if actuators with voltage inputs are connected;
- power the VG-VG0 analogue outputs at the same voltage on G-G0: Connect G0 to VG0 and G to VG. This is valid for both alternating and direct current power supplies.

2.2.7 Digital outputs NO..., NC...

Туре	Relay. Minimum contact current: 50 mA.												
Maximum no	8: SMALL; 13: N	1EDIUM/ BUILT-IN DF	RIVER; 18:	LARGE;									
Insulation distance	The relay outputs have different features depending on the model of controller. The outputs can be divided into groups. The re to the same group (individual cell in the table) have basic insulation and therefore must have the same voltage. Between grou table) there is double insulation and consequently these may have different voltages. There is also double insulation between ex- the digital outputs and the rest of the controller. Relays with the same insulation								groups	(cells in the

Tab. 2.a

2.2.8 SSR outputs (in models where featured)

Maximum number	2: SMALL (ouputs 7, 8); 2: MEDIUM (oup	uts 7, 12); 6: LARGE (ouputs 7, 8, 12, 13, 14, 15)
Working voltage	24 Vac/Vdc	
Load current (MAX)	1 A	
Impulsive load current (MAX)	1.2 A	
		Tab. 2.j

Warnings:

- if the load requires higher current, use an external SSR;
- to power external resistive loads via SSRs, use the same power supply as the pRack (supplied to terminals G-G0), which must be dedicated and not shared by other devices (contactors, coils, etc..);
- the groups that the digital outputs are divided into have two common pole terminals to simplify wiring;
- make sure that the current running through the common terminals does not exceed the rated current of an individual terminal, that is, 8 A.

2.2.9 Serial port - Use AWG 20-22 twisted pair shielded cable for the +/-

Serial	Type/connectors	Features
Serial ZERO	pLAN/J10, J11	Integrated on main board
		HW driver: asynchronous half duplex RS485 pLAN
		Not optically-isolated
		Connectors: 6-pin telephone jack + 3-pin plug-in p. 5.08
		Maximum length: 500 m
		Max data rate: 115200 bit/s
		Maximum number of connectable devices: 3
Serial ONE	BMS 1 Serial Card	Not integrated on main board
		HW driver: not featured
		Can be used with all pRack family optional BMS cards
Serial TWO	FieldBus 1 Serial Card	
		HW driver: not present
		Can be used with all pRack family optional FieldBus cards
Serial THREE	BMS 2 / J25	Integrated on main board
		HW driver: asynchronous half duplex RS485 Slave
		Optically-isolated
		3-pin plug-in connector p. 5.08
		Maximum length: 1000 m
		Max data rate: 384000 bit/s
Serial FOUR	FFieldBus 2 / J26 (and	
	J23 on Large and	J23: not optically-isolated
	Extralarge version)	J26: optically-isolated
		3-pin plug-in connector p. 5.08
		J23 and J26 are independent.
	I	Tab. 2.k

Note: in industrial/residential environments, for distances > 10 m, shielded cable is required, with the shield connected to earth. In residential environments (EN 55014), irrespective of the cable length, on versions without valve driver, the connection cable between the controller and the terminal and the serial cable must be shielded and connected to earth at both ends.

3. INSTALLATION

3.1 General installation instructions

3.1.1 Installation procedure

Environmental conditions

Avoid assembling the pRack pR300 and the terminal in environments with the following characteristics:

- temperature and humidity that do not conform to the rated operating data of the product;
- strong vibrations or knocks;
- exposure to aggressive and polluting atmospheres(e.g.: sulphur and ammonia fumes, saline mist, smoke) so as to avoid corrosion and/or oxidation;
- strong magnetic and/or radio frequency interference (therefore avoid installing the units near transmitting antennae);
- exposure of the pRack pR300 to direct sunlight and to the elements in general;
- large and rapid fluctuations in the room temperature;
- environments containing explosives or mixes of flammable gases;
- exposure to dust (formation of corrosive patina with possible oxidation and reduction of insulation).

Positioning the instrument inside the panel

The position of the instrument in the electrical cabinet must be chosen so as to guarantee correct physical separation of the instrument from the power components (solenoids, contactors, actuators, inverters, ...) and the connected cables. Proximity to such devices/cables may create random malfunctions that are not immediately evident. The structure of the panel must allow the correct flow of cooling air.

3.1.2 Wiring procedure

When laying the wiring, "physically" separate the power part from the control part. The proximity of these two sets of wires will, in most cases, cause problems of induced disturbance or, over time, malfunctions or damage to the components. The ideal solution is to house these two circuits in two separate cabinets. Sometimes this is not possible, and therefore the power part and the control part must be installed inside the same panel. For the control Signals, it is recommended to use shielded cables with twisted wires.

If the control cables have to cross over the power cables, the intersections must be as near as possible to 90 degrees, always avoiding running the control cables parallel to the power cables.

- Use cable ends suitable for the corresponding terminals. Loosen each screw and insert the cable ends, then tighten the screws. When the operation is completed, slightly tug the cables to check they are sufficiently tight;
- separate as much as possible the sensor Signal, digital input and serial line cables from the cables carrying inductive loads and power cables to avoid possible electromagnetic disturbance. Never insert power cables (including the electrical cables) and probe Signal cables in the same conduits. Do not install the sensor cables in the immediate vicinity of power devices (contactors, circuit breakers or similar);
- reduce the path of the sensor cables as much as possible, and avoid spiral paths that enclose power devices;
- avoid touching or nearly touching the electronic components fitted on the boards to avoid electrostatic discharges (extremely damaging) from the operator to the components;
- if the power transformer secondary is earthed, check that the earth wire corresponds to the wire that runs to the controller and enters terminal G0; this applies to all the devices connected to the pRack pR300;
- do not secure the cables to the terminals by pressing the screwdriver with excessive force, to avoid damaging the pRack pR300;
- for applications subject to considerable vibrations (1.5 mm pk-pk 10/55 Hz), secure the cables connected to the pRack pR300around 3 cm from the connectors using clamps;
- if the product is installed in industrial environments (application of the EN 61000-6-2 standard) the length of the connections must be less than 30 m;
- all the very low voltage connections (analogue and 24 Vac/Vdc digital inputs, analogue outputs, serial bus connections, power supplies) must have reinforced or double insulation from the mains network;

- in residential environments, the connection cable between the pRack pR300 and the terminal must be shielded;
- there is no limit to the number of cables that can be connected to an individual terminal. The only limitation concerns the maximum current crossing each terminal: this must not exceed 8 A;
- the maximum cross-section of the cable that connected to a terminal is 2.5 mm² (12 AWG);
- the maximum value of the twisting torque to tighten the screw on the terminal (torque tightening) is 0.6 Nm;

Important:

- Installation must be performed according to the standards and legislation in force in the country where the device is used;
- for safety reasons the equipment must be housed inside an electrical panel, so that the only accessible part is the display and the keypad;
- in the event of malfunctions, do not attempt to repair the device, but rather contact the CAREL service centre;
- the connector kit also contains the stick-on labels.

3.1.3 Anchoring the pRack pR300

The pRack pR300is installed on a DIN rail. To fasten the unit to the DIN rail, press it lightly against the rail. The rear tabs will click into place, locking the unit to the rail. Removing the unit is just as Simple, using a screwdriver through the release slot to lever and lift the tabs. The tabs are kept in the locked position by springs.

3.2 Power supply

Power supply to the	2836 Vdc +10/-20% or24 Vac +10/-15% 5060 Hz;
pRack pR300 S, M;	Maximum current P= 15 W (power supply Vdc). P=40 VA
L (controller with	(Vac)
terminal connected)	
Power supply to	DC power supply: 48 Vdc (36 Vmin72 Vmax)
the pRack pR300	AC power supply: 24 Vac +10/-15 %, 50/60 Hz
Compact	Maximum current P=11W, P=14VA, Imax=700mA

Tab. 3.a

Important:

- power supplies other than those specified seriously damage the system;
- in the installation, it is recommended to supply just one pRack pR300 controller using a class 2 safety transformer - 100 VA for the models with built-in driver, and 50 VA for the pRack S, M, L models;
- the power supply to the pRack pR300 controller and terminal (or pRack pR300 controllers and terminals) should be separated from the power supply to the other electrical devices (contactors and other electromechanical components) inside the electrical panel;
- if the power transformer secondary is earthed, check that the earth wire corresponds to the wire that runs to the controller and enters terminal G0. This applies to all the devices connected to the pRack pR300;
- a yellow LED indicates that power is connected to the pRack pR300.

3.3 Universal inputs/outputs

Universal inputs/outputs are distinguished by the letter U... They can be configured from the application program for many different uses, such as the following:

- passive temperature probes: NTC, PTC, PT100, PT500, PT1000;
- · active pressure/temperature/humidity probes;
- ratiometric pressure probes;
- current inputs, 0 to 20 mA or 4 to 20 mA;
- voltage inputs, 0 to 1 Vdc or 0 to 10 Vdc;
- · voltage-free contact digital inputs and fast digital inputs;
- analogue outputs, 0 to 10 Vdc;
- PWM outputs.

Important:

• the universal inputs/outputs cannot be used as digital outputs.

Max. number of connectable analogue inputs

The maximum number of analogue inputs that can be connected to the universal inputs/outputs depends on the type used.

	Max. number of inputs connectable to universal inputs/outputs						
			05+				
	Type of signal	Sn	nall		Medium/ Built-in driver/ Extralarge		Large
	- NTC/PTC/PT500/PT1000 probes	5		8		10	
	- PT100 probes	2			2 on U1U5, on U6U8)	1 c	2 on U1U5, on U6U8, on U9U10)
	- 0 to 1 Vdc/0 to 10 Vdc signals from controller- powered probes	nax. 5	5	max. 8	6	max. 10	6
Analogue inputs	- 0 to 1 Vdc/0 to 10 Vdc signals from externally powered probes	Tot. max	5	Tot. r	8	Tot. m	
Analogu	- 0 to 20 mA/4 to 20 mA inputs from controller- powered probes	max. 4	4	max. 7	6: (max 4 on U1U5, 3 on U6U8)	лах. 9	6: (max 4 su U1U5, 3 on U6U8, <u>2 on U9U10)</u>
	- 0 to 20 mA/4 to 20 mA inputs from externally powered probes	Tot. n	4	Tot. n	7: (max 4 on U1U5, 3 on U6U8)	Tot. max.	9: (max 4 on U1U5, 3 on U6U8, 2 on U9U10)
	- 0 to 5 V signals from controller-powered ratiometric probes	5		6		6	
							Tab. 3.a

Note: The table shows the maximum number of inputs that can be connected. For example, a Small controller can be connected to a maximum of five 0 to 1 Vdc inputs from controller-powered probes and a maximum of five 0 to 1 Vdc inputs from externally powered probes. In any case, the maximum number of inputs of both kinds that can be connected is 5.

3.3.1 Connecting universal NTC temperature sensors

For information on the maximum number of probes that can be connected see the table at the beginning of this paragraph. The analogue inputs are compatible with 2-wire NTC sensors. The inputs must be set for NTC Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

Note: the two wires of the NTC sensors are equivalent, as they have no polarity, therefore it is not necessary to follow any specific order when connecting to the terminal block.

3.3.2 Connecting PT1000 temperature sensors

For information on the maximum number of probes that can be connected see the table at the beginning of this paragraph. The pRack pR300 can be connected to 2-wire PT1000 sensors for all high temperature applications; the operating range is: -100 to 200 °C. The inputs must be pre-configured for PT1000 Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

Important: for correct measurement by the PT1000 sensor, each sensor wire needs to be connected to a dedicated terminal, as shown in Fig. 3.b.

Note: the two wires of the PT1000 sensors are equivalent, as they have no polarity, therefore it is not necessary to follow any specific order when connecting to the terminal block.

3.3.3 Connecting current pressure probes

For information on the maximum number of probes that can be connected see the table at the beginning of this paragraph pRack pR300 can be connected to all CAREL SPK* series active pressure probes or any other pressure sensors available on the market with 0 to 20 mA or 4 to 20 mA Signal. The inputs must be set for 0 to 20 mA or 4 to 20 mA signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

Important: do not connect the green wire.

3.3.4 Connecting 0 to 5 V ratiometric pressure probes

For information on the maximum number of probes that can be connected see the table at the beginning of this paragraph. pRack pR300 can be connected to any other pressure probes available on the market with 0 to 5 V ratiometric sensor. The inputs must be set for 0 to 5 V Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

Hardware	Terminals	Probe wire	Description
Version		colour	
S, M, D, L	+5 V ref	black	power supply
	GND	green	power supply reference
	U1U10, S1, S3	white	Signal
			Tab. 3.e

3.3.5 Connecting 0 to 10 V active probes

For information on the maximum number of probes that can be connected see the table at the beginning of this paragraph. pRack pR300 can be connected to 0 to10 V sensors. The inputs must be set for 0 to10 V Signals from the user terminal or using the default value installation procedure. The connection diagram is shown below:

3.3.6 Connecting analogue inputs selected as ON/OFF

For information on the maximum number of probes that can be connected see the table at the beginning of this paragraph. The pRack pR300 allows some analogue inputs to be configured as voltage-free digital inputs, not optically-isolated. The inputs must be pre-configured as voltage-free digital inputs from the user terminal or using the default value installation procedure.

Important:

- the maximum current available at the digital input is 5 mA (thus the rating of the external contact must be at least 5 mA).
- these inputs are not optically-isolated.

3.3.7 Remote connection of the analogue inputs

The Sizes of the cables for the remote connection of the analogue inputs are shown in the following table:

Type of input	Size [mm ²] for	Size [mm ²] for
	length up to 50 m	length up to 100 m
NTC	0.5	1.0
PT1000	0.75	1.5
current	0.25	0.5
voltage	0.25	0.5
		Tab. 3.h

If the product is installed in industrial enviroment (in compliance for the EN 61000-6-2 standard) the length of the connections must be less than 30m. In any case you should never exceed this length to have no measurement errors.

3.4 Connecting the digital inputs

The pRack pR300 features digital inputs for connecting safety devices, alarms, device status and remote switches. These inputs are all optically isolated from the other terminals at 24 Vac, 24 Vdc and some at 230 Vac for M, D, L models.

Note: separate the sensor Signal and digital input cables as much as possible from the inductive load and power cables, to avoid possible electromagnetic disturbance.

Important:

- if the control voltage is drawn in parallel with a coil, fit a dedicated RC filter in parallel with the coil (the typical ratings are 100 Ω , 0.5 μ F, 630 V).
- If connecting the digital inputs to safety systems (alarms), remember that: the presence of voltage across the contact must be the normal operating condition, while no voltage must represent an alarm situation. This will ensure that any interruption (or disconnection) of the input will also be Signalled. Do not connect the neutral in place of an open digital input. Always interrupt the phase. The 24 Vac/Vdc digital inputs have a Resistance of around 5 k Ω .

All pRack digital inputs can be powered at 24 Vac and 24 Vdc, while for models M, D, L only 230 Vac inouts are also available. To maintain the optical isolation of the digital inputs, a separate power supply must be used just for the digital inputs. The connection diagrams shown in these figures, which while being the more common and the more convenient, do not exclude the possibility of powering the digital inputs independently from the power supply to the pRack pR300. In any case, the inputs only have functional insulation from the rest of the controller.

24 Vac digital inputs

The following figure represents an example for connecting the 24 Vac digital inputs on pRack models S, M, L.

The following figure represents an example for connecting the 24 Vdc digital inputs on pRack models S, M, L.

Fig. 3.h

230 Vac digital inputs

pRack M, D, L models have up to two groups of inputs powered at 230 Vac 50/60 Hz +10/-15%; each group features two inputs. The groups have double insulation between them and can have different voltages.

Important: within each group the inputs must be powered at the same voltage to avoid short-circuits or powering lower voltage inputs at 230 Vac.

The range of uncertainty of the switching threshold is from 43 to 90 Vac. It is recommended to use a 100 mA fuse in series with the digital inputs. The following figure represents an example for connecting the 230 Vac digital inputs on pRack models M, D, L.

Fig. 3.i

Remote connection of the digital inputs 3.4.8

Important note: do not connect other devices to the digital inputs IDn inputs.

The Sizes of the cables for the remote connection of the digital inputs are shown in the following table:

Size (mm²) for length up to 50 m Size (mm²) for length until 100 m 0.5

If the product is installed in industrial environments (application of the EN 61000-6-2 standard) the length of the connections must be less than 30 m. This length shouldn't be exceeded in any case, to avoid measurement errors.

Connecting the analogue outputs 3.5

Connecting 0...10 V analogue outputs 3.5.1

The pRack pR300 provides 0...10 V optically-isolated analogue outputs, powered externally at 24 Vac/Vdc.

The figure below shows the electrical connection diagram; the OV (zero) of the power supply is also the reference for the output voltage:

Hardware Version	Terminals	Reference	
S, M, D	Y1, Y2, Y3, Y4	VG0	
L	Y1, Y2, Y3, Y4, Y5, Y6	VG0	
			Tab. 3.i

3.5.2 **Optional modules**

Module for converting a PWM analogue output to a liner 0...10 V and 4...20 mA analogue output (code CONV0/10A0)

The module is used to convert a PWM output (5 V pulses) to a liner 0...10 V and 4...20 mA analogue output (code CONV0/10A0). The control Signal (at the input terminals optically-isolated from the rest of the module) must have a maximum amplitude of 5V and a period between 8 ms and 200 ms. The 0...10 V output voltage can be connected to a maximum load of 2 k Ω , with a maximum ripple of 100 mV. The 4...20 mA current output can be connected to a maximum load of 280 Ω , with maximum overshoot of 0.3 mA. The mechanical dimensions of the module are 87x36x60 mm (2 DIN modules) with IP20 index of protection.

Module for converting a 0...10 V analogue output to an SPDT digital output (code CONVONOFF0)

The module is used to convert a 0...10 V analogue output to an ON/OFF relay output. The control Signal (at the input terminals, optically-isolated from the rest of the module), to ensure the switching of the relay from OFF to ON, must have a maximum amplitude of 3.3 V. The relay is SPDT, with max current of 10 A and max inductive load of 1/3 HP. The mechanical dimensions of the module are 87x36x60 mm (2 DIN modules) with IP20 index of protection.

3.6 Connecting the digital outputs

Electromechanical relay digital outputs 3.6.1

The pRack pR300 features digital outputs with electromechanical relays. For ease of installation, the common terminals of some of the relays have been grouped together.

The following figure illustrates a connection example. If the following this diagram is used, the current at the common terminals must not exceed the rating (nominal current) of a single terminal (8 A).

Fig. 3.k

The relays are divided into groups, according to the degree of insulation. Inside each group, the relays have just basic insulation and thus must have the same voltage (generally 24V ac or 110 to 230 Vac). Between the groups there is double insulation and thus the groups can have different voltages. There is also double insulation from the rest of the controller.

Changeover outputs

Some relays feature changeover outputs, the number of changeover outputs depends on whether or not there are solid state relays (SSR) and consequently varies depending on the models.

Hardware version	Changeover relay reference, without SSR model	Terminal
PRK300**F* models		
S	8	J15
M, D	8, 12, 13	J15, J17, J18
L	8, 12, 13, 14, 15	J15, J17, J18, J21
		Tab. 3.j

Solid state relay (SSR) digital outputs 3.6.2

The pRack pR300 also features a Version with solid state relays (SSR) on some models for controlling devices that require an unlimited number of switching cycles and thus would not be supported by electromechanical relays (e.g. screw compressor valves). They are dedicated to loads powered at 24 Vac/Vdc with a maximum power Pmax = 10 W.

Important: the SSRs can control resistive loads powered at 24 Vac/Vdc. For details see paragraph 2.2.8.

The figure shows a connection example for resistive loads.

Fig. 3.I

The following figure illustrates correct applications for inductive loads.

Fig. 3.m

Fig. 3.n

The table below shows the reference outputs for pRack models fitted with SSR outputs.

Hardware version	Reference relay SSR	Terminal
S	7,8	J14, J15
M, D	7,12	J14, J17
L	7, 8, 12, 13, 14, 15	J14, J15, J17, J18, J21
		Tab. 3.k

Important: the SSR relay load is powered at 24 Vac/Vdc, thus all the other terminals in the group must be powered at 24 Vac/Vdc due to the absence of double insulation within the group.

3.6.3 Summary table of digital outputs according to the Versions available

Hardware version	contacts	NC contacts	Changeover contact	n.ro outputs	relay in SSR
PRK300**E	* Models	-	_	8	2 (7, 8)
M, D	9	-	2 (8, 13)	13	2 (7, 12)
L	12	-	-	18	6 (7, 12, 13, 14, 15)
PRK300**F	* Models				
S	7	-	1 (8)	8	-
M, D	10	-	3 (8, 12, 13)	13	-
L	13	-	5 (8, 12, 13, 14, 15)	18	-
					Tab. 3.I

3.6.4 Remote connection of the digital outputs

The Sizes of the cables for the remote connection of the digital outputs are shown in the following table:

AWG	Size [mm ²]	Current [A]
20	0,5	2 A
15	1,5	6 A
14	2,5	8 A
		Tab. 3.m

If the product is installed in industrial environments (application of the EN 61000-6-2 standard) the length of the connections must be less than 30 m. This length shouldn't be exceeded in any case.

3.7 pLAN electrical connections

If the selected system configuration involves the connection of more than one pRack pR300 board in a pLAN, AWG20/22 twisted pair shielded cable must be used, with capacitance between the wires less than 90 PF/m.

The maximum length of the pLAN network is 500 m with AWG22 twisted pair shielded cable.

The boards should be connected in parallel with reference to plug-in connector J5 (pRack Compact) or J11 (versions S, M, L).

Important: follow the network polarity: RX/TX+ on one board must be connected to RX/TX+ on the other boards; the same applies to RX/TX-.

The figure shows the diagram for more than one board connected in a pLAN network; this is a typical application with more than one board connected inside the same electrical panel.

Important: pLAN connections are possible in which more than one board is powered by different transformers; for further details see pRack system general manual: +030220335.

3.7.1 Connecting the terminals

pRack pR300 uses PGD1 terminals, either built-in or external connected via pLAN. Up to 2 external terminals can be connected, with pLAN addresses 31 and 32.

The connection can be made using 6-wire telephone cables (connector J4 for Compact models or J10 for S, M, L) or shielded twisted pair cables with 3-pin plug-in connectors (connector J5 for Compact models or J11 for S, M, L), as shown in the table

Cable type	Power supply distance	Power supply
6-pin phone	10 m	Taken from pRack (150 mA)
(J10)		
AWG24	200 m	Taken from pRack (150 mA)
AWG20/22	500 m	Separate, via TCONN6J000
		Tah 3 n

For further details on connecting the terminals, see the pRack system general manual: +030220335.

4. **START UP**

Starting the first time 4.1

After having correctly installed pRack, a number of preliminary operations are required to configure the installation.

Tutorial: the pRack pR300 configuration procedure varies according to the complexity of the installation:

- systems with only one board and maximum one external terminal. In this case, simply connect the terminal (if not built-in), power up the board and select one of the configuration solutions described below.
- systems with more than one board in pLAN or two external terminals. IIn this case, the additional operations described in Appendix A. 2 need to be completed before proceeding with configuration.

The procedure for configuring an installation described below is the same for all system configurations that feature just one pRack pR300 board, and for system configurations with more than one board connected in a pLAN.

When first starting the pRack pR300 board, after waiting around 1 minute. a screen is shown for choosing the language used to display the program (English or Italian).

Press ENTER (4) to change the language displayed, while pressing ESC displays the following screen.

- If no option is chosen within a time set by parameter and visible on the screen, the current language remains selected.
- pRack pR300 is available as standard with English and Italian languages loaded on board. Other languages are available at ksa.carel.com that can be loaded onto the control using the pRack Manager software, following the procedure described in Chap. 10.

After having selected the user interface language, the pRack pR300 software shows a screen for choosing between three possible system configuration solutions, as follows:

- Pre-configurations
- Wizard
- Advanced configuration.

Summary of pre-configurations

Important:

- after having configured the system, the configuration can be modified, it can be modified by repeating the same procedure, making sure the Carel default values have been reset as described in paragraph 6.8.2.
- after having configured the system, power down the controller and power up again.

4.1.1 **Pre-configurations**

This solution is used to choose between fourteen configurations preloaded in the pRack pR300 software. For the description of the preconfigurations see the table below, while for the complete description of each configuration see Appendix A1.

pRack pR300 automatically configures the inputs and outputs as described in paragraph 4.1.4; for details on the inputs and outputs associated with each pre-configuration, see the quick guide code +040000070.

4.1.2 Wizard

start UP
select config.Item:
WIZARD
Answer the questions
to have a fully
configuration

Fig. 4.b

This solution is used to obtain the recommended configuration for the specific installation. By responding to a series of questions, screen by screen, the user is guided through the selection of the devices present. Once the guided selection procedure has been completed, the end result (report) is shown, and if the configuration is suitable the parameters to start operation of the pRack pR300 can be installed directly, including those associated with the inputs and outputs as described in parag. 4.1.4.

Note: after having configured the parameters using the Wizard, the configuration can be modified manually, within the context of the selected system configuration.

Important: before starting the pRack pR300, carefully check the settings made automatically by the software.

Tutorial: Appendix A.3 shows a configuration example using the Wizard for an installation with two suction lines.

			compressors							Units in the pLAN(as well	pRack pR300 Version

(*) configuration not available in versions 1.0 and 1.1 of the pRack software.

4.1.3 Advanced configuration

start UP
Select config.Item:
ADVANCED CONFIGURATION
It ONly defines the
structure of the Plant
For very expert users

This solution is used to establish the configuration of the pLAN structure required for correct system operation.

Once the procedure for selecting the various factors that affect the final configuration has been completed, the pRack pR300 software verifies whether the pLAN configuration is exact and prepares the user interface for configuration of the parameters that need to be set manually by the user.

Important: this configuration solution is only recommended for expert users, as all the system parameters need to be set manually.

4.1.4 Associating the inputs and outputs

When using pre-configurations and the wizard, pRack pR300 can automatically associate the board's inputs and outputs with the various functions.

For the wizard only, after having configured the lines, automatic association can be chosen as an option. If choosing not to use this function, the I/Os need to be configured manually, according to requirements.

The criteria applied for automatic association are described below.

Digital outputs

pRack pR300 assigns in order:

- Compressor outputs: first the SSR outputs for screw or Digital Scroll™ then the starting outputs, the capacity control valves and the inverter, if present
- Fan outputs
- Global alarm.

Digital inputs

pRack pR300 assigns in order:

- High and low pressure switches (HP and LP)
- Compressor alarms
- Fan alarms

Note: pRack pR300 can also use certain analogue inputs as digital inputs, nonetheless the common HP and LP pressure switches are always associated with actual digital inputs.

Analogue inputs

pRack pR300 assigns in order:

- Pressure or temperature control probes for 1 or 2 lines, according to the settings made. The types of probe asSigned as default are 4...20 mA or 0 to 5 V (first 4...20 mA, then 0 to 5 V if necessary) for the pressure probes, NTC for the suction temperature probes and HTNTC for the condensing temperature probes;
- Suction temperature probe on line 1: if possible this is associated with input B3, otherwise the first free input;
- Discharge temperature probe on line 1;
- Suction temperature probe on line 2;
- Discharge temperature probe on line 2.

Analogue outputs

- pRack pR300 assigns in order:
- Compressor inverters for 1 or 2 lines;
- Fan modulating devices for 1 or 2 lines.

5. USER INTERFACE

5.1 Graphic terminal

The pRack pR300 user interface is represented by the pGD1 terminal, panel or built-in versions.

The functions associated with the 6 buttons on the pGD1 terminal are the same on all the screens and are described in the table below.

Functions of the 6 buttons

Button		Function associated
	(ALARM)	displays the list of active alarms and accesses the alarm log
Ο		used to enter the main menu tree
5		returns to the higher level screen
1	(UP)	scrolls a list upwards or increases the value highlighted by the cursor
$\mathbf{\Phi}$	(DOWN)	scrolls a list downwards or decreases the value highlighted by the cursor
ł	(ENTER)	enters the selected submenu or confirms the set value.
		Tab 5 a

The LEDs associated with the buttons have the following meanings.

Meaning of LEDs

LED	Button	Meaning	
Red	•	Flashing: active alarms present and not acknowledge	ged
		Steady: alarms present and acknowledged	
Yellow	Ο	pRack pR300 on	
Green	5	pRack pR300 powered	Tab. 5.b

5.2 Description of the display

There are three fundamental types of screens shown to the user:

- Main screen
- Customised main screen
- Menu screen
- Screen for displaying/setting the parameters

Main screen

The main screen is the screen that the software on board pRack pR300 automatically returns to 5 minutes after the last button was pressed.

An example of the main screen is shown in the figure, highlighting the fields and icons used:

5 0	Unit status (unit off) or compressor and fan status (unit on)	
4 A	Active alarm Signal and manual operation	

⁵ Access further information screens (menu branch A.a) by pressing button

Note:

the information shown on the main screen varies according to the system configuration (one line, two lines, two lines with shared condenser) and the type of control value used (pressure or temperature). For two line systems, a parameter is used to select which line is shown first. the other information shown in menu branch A.a. varies according to the system configuration. For two line systems, pressing I from the main screen accesses a different screen based on the starting point (line 1, line 2).

Customised main screen

pRack pR300 offers the possibility to configure the information displayed on the main screen and the second screen (pressing DOWN) as desired. For example, information on specific probes with physical readings (pressure or temperature), no longer grouped by screen but rather customised row-by-row on the display. The basic structure comprises two screens that are scrolled by pressing Up and Down; all the information can be configured for display on the main screen relating to pressure or temperature, the characteristic that is not selected will then be displayed on the secondary screen, only if significant.

Fig. 5.d

In the example, a suction line with control by pressure has been configured, the main screen displays the values read by the suction and condensing pressure probes, while the superheat is displayed in degrees centigrade; the secondary screen will show the converted temperatures of the suction and condensing pressure probe readings, together with the description of superheat by pressure, which is not displayed as this information would not be significant. By default the main screen will continue to show the same information as always displayed on the pR100 (depending on the type of configuration: SUCTION&CONDENSER, rather than SUCTION and the type of control PRESSURE/TEMPERATURE).

When starting the first time, the main screen will reflect the settings made. Custom configuration of the main screen is then performed subsequently, as described below:

The configuration is made under Settings -> Language in screen Fb04

BMain	Mask	Confi	9 Fb04
Probes	DON?	figura CONF	tion IGURE
Info o	config DON'	Jurati CONF	onsi IGUREI

On this screen, users can choose whether to configure the part relating to the probes, or the bottom bar with the percentages or number of active peripherals in the circuit. On screen Fb04, go to the field underneath "Probe configuration", change the value to "CONFIGURE" and press Enter. The following screen (Fb05) is displayed, which shows the layout of the main screen with the modifiable fields for each row. The following options are available:

Probe	Description
Suction	Suction used for single suction line
Condenser	Condenser used for single condenser line
Superheat	Superheat used for single suction line
L1 – Suction	Suction on line 1
L2 – Suction	Suction on line 2
L1 – Condenser	Condenser on line 1
L2 – Condenser	Condenser on line 2
Suction temperature	Suction temperature for single suction line
L1 - Suction temperature	Suction temperature on line 1
L2 - Suction temperature	Suction temperature on line 2
Discharge temperature	Discharge temperature for single suction line
L1 – Discharge temperature	Discharge temperature on line 1
L2 – Discharge temperature	Discharge temperature on line 2
Auxiliary	Auxiliary probe for single suction line
L1 - Auxiliary	Auxiliary probe on line 1
L2 - Auxiliary	Auxiliary probe on line 2
L1 - Superheat	Superheat on line 1
L2 - Superheat	Superheat on line 2
EVD1 - Condenser	Condenser line 2 connected to driver 1
EVD2 - Condenser	Condenser line 2 connected to driver 2

After having configured the required information, choose the characteristic to be displayed on the main screen, Pressure or Temperature.

To exit this screen, simply press Esc and return to the Language menu.

Information on bottom bar:

In screen Fb04, go on the field underneath the description "Info configuration", change the value to "CONFIGURE" and press Enter. The bottom bar can display information relating to a single line or double line; for single line, select whether to display L1 or L2.

Main Mask Config Bottom info. Visualization: L1	ONLY

	control EVS valves		

Double line configuration

In configurations that feature control of two suction lines, 4 different percentages can be shown from the values described in the previous table The customised main screen is simply an option that is available following configuration of the main screen in the Wizard.

Menu screen

An example of a menu screen is shown in the figure below:

The top right corner shows the selected item and the current password level (for details see the following paragraph). The \uparrow and \checkmark buttons are used to select the desired menu item, while \Leftarrow accesses the selected item.

Screen for displaying/setting the parameters

An example of a screen for displaying/setting the parameters is shown in the figure, also highlighting the fields and icons used:

The screen identifier uniquely identifies the menu branch and the screen: the first characters indicate the menu branch, while the last two alphanumeric digits identify the order of the screen inside the menu, for example screen Bab01 is the first screen in menu B.a.b.

Note: The information on the screens may vary according to the password level used to access the menu.

ENG

5.3 Password

pRack pR300 manages three levels of password:

- 🗖 User
- • Maintenance
- ■ Manufacturer

Each level includes the same rights as the lower levels, that is, the Manufacturer can access all the screens and parameters, the Maintenance can access the screens and parameters available in the Maintenance and User levels, while the User can only access the screens and parameters available in the User level.

Note: All levels display the main screens and the other information screens.

When pressing **O** a prompt is shown to enter the password, which remains active for 5 minutes after the last button is pressed.

The menu screens show their own password level using an icon at the top right: ■ 1 line: user, ■ 2 lines: maintenance, ■ 3 lines: manufacturer.

The password level can be changed from menu branch F.d. at any time. The password can also be changed in the corresponding menu branch.

5.4 Description menu

Main menu – Function tree

The following general rules apply to the user interface:

- The parameters are grouped by functions and where necessary repeated, for example the status of the compressors inputs/outputs is visible in both branch C.a.a (Compressors), and in branch B.a (Inputs/ Outputs)
- The parameters are grouped by type of access, first User then Maintenance then Manufacturer
- The most frequently used parameters are indicated first, the less frequently used are last
- Each user only sees the parameters and menu items that are available for that access level
- Only the screens and parameters corresponding to the selected system configuration are visible, that is, corresponding to the devices configured. The exception to this rule involves the screens relating to functions that can be enabled/disabled (e.g. set point compensation), which are visible even when disabled.

Regardless of the current screen displayed, pressing the **O** button accesses the main menu, as shown below:

- The figure illustrates the maximum menu configuration visible with the Manufacturer password. If accessing with the User or Maintenance password, only the menu items available are visible
- For some menu items, access is possible with different password levels (e.g. I/O status), but the information available on the screens changes.

6. FUNCTIONS

pRack pR300 can manage up to 2 suction lines and 2 condenser lines. Many of the functions described in this chapter apply in the same way to all the lines (e.g.: control, rotation), while others apply in the same way to the suction lines (e.g.: oil management). The exception involves the generic functions that apply, irrespective of line, suction or condenser, to pRack boards with pLAN addresses from 1 to 4. Where not expressly indicated or where it is clear that the description refers to one specific line rather than another (e.g.: compressor or fan management), the descriptions are considered as being common to all lines; any specific Situations are described on a case-by-case basis.

Below is a chart of the main functions described and their field of application:

	Function	L1 suction	L2 suction	L1 condens.	L2 condens.
	Unit On-Off		√		\checkmark
Control	P+I control		√		
	Control in Neutral zone		√

	Generic functions (*)	(*)	(*)	(*)	(*)
	ChillBooster	-	-		
	DSS			-	-

(*) not linked to lines, but rather the pLAN address of the boards

The functions are described in detail in the following paragraphs.

6.1 Unit On-Off

The unit can be switched on and off from:

- User terminal
- Supervisor
- Digital input

On-off from the user terminal and the configuration parameters are available under the main menu, branch A.c, and are differentiated based on the access level; the User password allows display only.

On-off from the supervisor and from the digital input and start-up after a blackout (with specific delay, to avoid continuous starts and stops in the event of instability in the power supply) must be enabled using the parameters visible only with the Manufacturer password.

On-off from the digital input is equivalent to an enabling Signal, that is, if the digital input is Off the unit cannot be switched on in any other way, while if is On, the unit can be switched on or off in any other way, with the same priority (the most recent control has precedence, whatever the origin), as shown in the figure:

When there are two suction and condenser lines, on-off is independent for each line, while when there are two suction lines and one condenser line, it is independent for the suction lines, while the condenser line stops when both suction lines are off, and starts when at least one suction line is on.

Tah 6 a

Note: Certain special conditions or functions in the pRack software cause the unit to shutdown:

- Configuration of some parameters: e.g. inputs/outputs, configuration of compressors, inverter parameters.
- Installation of default parameters
- Manual management

6.2 Control

pRack pR300 can manage two types of control:

- Proportional band (P, P+I);
- Neutral zone (fixed times, variable times).

Both types of control can be applied to both compressors and condensers, according to the settings defined during start-up or in main menu branches C.a.b/C.b.b and D.a.b/D.b.b.

The type of control chosen is independent for each line present, either suction or condenser.

In addition, pRack pR300 can use as the reference for control either the pressure or the converted temperature, or the temperature read by probe if there is no pressure probe, even if reference is only made to pressure below.

The control set point can be compensated by an offset linked to digital inputs, probes, supervisor or time bands, for details see paragraph 6.5 relating to compressor and fan energy saving.

Both types of control are described below, and are valid for both control of suction pressure and condensing pressure, and operation with backup probes and/or probes not working.

6.2.1 Proportional band

The operating principle is normal proportional or proportional + integral control (P, P+I).

The control set point is central, consequently - for proportional control only - operation is schematised in the following figure:

For example, for 4 devices with the same capacity and proportional only control, start-up occurs as shown in the figure:

With P+I control, added to the effect of the proportional action described above is the integral action, used to achieve a null control error in steady operation, as shown in the figure:

The integral action depends on the time and the deviation from the set point. This modifies the request if the control value does not approach the set point for some time.

The integral time setting represents how fast integral control is implemented:

- low values determine fast and intense control action
- high values determine slower and more stable control action

It is recommended to not set a value that is too low for the integral time, to avoid instability.

Note: the set point is in the centre of the activation band, therefore when reaching the set point some devices are on, even with purely proportional control.

6.2.2 Neutral zone

The operating principle is schematised in the following figure:

Inside the neutral zone the capacity request sent by the controller is constant (except when there is a modulation device and modulation is enabled inside the neutral zone, as described in the following paragraph) and the value satisfies the temperature control request in those specific operating conditions, therefore within this zone no device is stopped or started.

In the decrease zone, the request also decreases at a rate that depends on the deviation from the set point, and vice-versa in the increase zone the request increases proportionally to the deviation.

For the increase and decrease zones, the following can be used:

- Fixed times: the request decreases or increases constantly as time elapses.
- Variable times: the request decreases or increases more quickly (according to the settings) as the deviation from the set point increases.

Note: The previous figure shows the increase and decrease with fixed times.

For control in Neutral zone, the parameters shown in the figure must be set:

As well as the decrease and increase differentials, 4 times need to be set, two for each zone, which represent the maximum and minimum time to reach the request, equal to 0% or 100%, for the decrease and increase respectively.

Tutorial: the decrease/increase times (minimum and maximum) represent the time needed to change from maximum to minimum capacity and vice-versa, and not the time between the deactivation/ activation of the individual device. For example, in the case of 4 devices with the same capacity, an increase time of 180 s means that one device is activated every 45 s.

In the situation shown in the figure, the request sent by the controller decreases/increases slowly as soon as the controlled value is outside of the Neutral zone, while it decreases/increases quickly the further the controlled value moves away from the Neutral zone; in this way the response of the system is faster when further from steady conditions.

Note: When using fixed times, the maximum and minimum must be set to the same value. In this case, the request sent by the controller decreases/increases constantly inside the deactivation/ activation differential.

6.2.3 Modulation in Neutral zone

pRack pR300 can activate a specific function inside the Neutral zone if modulating devices are used (e.g.: inverters).

This function can be enabled in main menu branch C.a.g/C.b.g or D.a.g/ D.b.g.

Modulation in Neutral zone is used to vary the request sent by the controller inside the Neutral zone proportionally so as to enter the decrease zone with the minimum request and the increase zone with the maximum request, meaning a device can be immediately deactivated/ activated when exiting the Neutral zone.

This makes it possible to remain longer inside the neutral zone without starting or stopping any device.

An example of this operation is shown in the figure:

When entering the Neutral zone, the pRack pR300 software calculates how the request needs to change in order to exit the Neutral zone at minimum or maximum output, and applies one of the two values according to the trend in variation in the control variable. For example, at point P1 in the figure, the trend of the two requests is represented by the segments with thin lines, and the request 'reverses' because at that point the control variable has started increasing in value again.

Note: When exiting the Neutral zone, it is possible that the request is not at the minimum or maximum value, where limitation is enabled for of the modulating device variation speed.

6.2.4 Control with backup probes and/or probes not working

pRack pR300 can use backup control probes that are activated when the normal control probes are not working.

The backup probes must be enabled in main menu branch C.a.g/C.b.g or D.a.g/D.b.g.

When different pRack boards are used to manage the suction and condenser lines, the backup suction pressure probe must be connected to the board that manages the suction line, while the backup condensing pressure probe can be connected either to the board that manages the suction line or the board that manages the condenser line.

If the main control probes are not working and no backup probes are fitted, or the backup probes are also not working, or the corresponding temperature probes are also not working, fixed values are used for the control request, set in main menu branch C.a.g/C.b.g or D.a.g/D.b.g.

6.2.5 Auxiliary control

pRack pR300 offers the possibility to control the compressors on a single suction line (or L1 for double lines) using an auxiliary probe. Normal control based on the suction pressure probe reading (or converted temperature) can be replaced by control based on a different probe. This solution can manage the secondary refrigerant in "water chiller" or "pumped" systems, offering greater system stability and at the same time guaranteeing compressor safety via the suction probe, which must always be installed.

Auxiliary control is enabled under "Compressors -> Control", selecting the type of control (by temperature or pressure) and the type of refrigerant, which may differ from the main one.

Comp.RegulL1	Cab20
Enable Aux re9.:	NO
Probe reg.type: PRESS	URE
Refrig.type:	R404A

The function does not need to be enabled if "water chiller" is set in the installation Wizard

W i	z	a	r	d	Ĩ.											I	b	0	1
Тэг	•e		0	f		i	n	5	t	9	1	1	a	t	i	0	n	:	
	s	U	с	т	I	0	N		63		с	0	N	D	E	Ы	5	E	R
P1;	an	t	:					W	A	т	E	R	С	Н	I	L	L	E	R

as auxiliary control by temperature probe is enabled automatically. Choosing a "pumped" system, on the other hand, automatically enables auxiliary control by pressure probe (see Appendix A.2)

Once the auxiliary probe is enabled on screen Cab20, the associated universal input, the probe type, the correct limits (for pressure probes) and calibration (if necessary) can be selected under "Inputs Outputs -> Status -> Analogue inputs"

The type of control, band limits or differentials and the set point need to be configured under "Compressors -> Control", in the same way as for traditional control.

The limits for the auxiliary probe alarms, are set under "Compressors -> Alarms" and need to be configured depending on the type of probe and refrigerant. When an alarm goes off, this is saved in the log, with a special screen shown when pressing the alarm bell.

Aux.Alarms	Cae32	Aux.Alarms	Cae33
Auxiliary Temperature hi9h alarm:	ABSOLUTE	Auxiliary Temperature alarm diff.:	5.0°C
Threshold:	10.0°C	Alarm delay:	120s
0	074		
Aux.Alarms	Cae34	Aux.Alarms	Cae35
Aux.Alarms Auxiliary Temperature low alarm:	Cae34 ABSOLUTE	Aux.Alarms Auxiliary Temperature alarm diff.:	Cae35 5.0°C

Note: when auxiliary control is enabled, it is recommended to also enable the prevent low suction pressure function, see paragraph 8.3.4 (prevent low suction pressure). In case of pumped systems, don't configure the second condensing line.

6.3 Compressors

pRack pR300 can manage up to 2 suction lines with different types of compressors and capacity modulation devices, applying common types of device rotation and controlling both the start mode and the safety times for each type of compressor, as well as a number of accessory functions.

The compressor functions and related parameter settings are enabled from main menu branch C.a/C.b.

These features and functions are described in detail in the following paragraphs.

6.3.1 Possible compressor configurations

pRack pR300 can manage different types of compressors:

- Reciprocating
- Scroll
- Screw

Moreover, a capacity modulation device is allowed for each suction line, which may be one of the following, according to the type of compressor:

Compressors and modulation devices

Compressors	modulation devices	
Reciprocating	Inverter	
Scroll	Inverter	
	Digital Scroll™	
<u> </u>	Inverter	
Screw	Continuous capacity control	
Bitzer CRII	Modulating capacity control	
		Tah 6 h

Note: The same modulation device is used on each line.

The maximum number of compressors and load stages per line varied according to the type of compressor:

Compressors and modulation devices

Compressors	Maximum No.	Load stages	
Reciprocating	12	24 total	
Scroll	12	24 total	
Screw	2	4	
Bitzer CRII	2	3	
		·	Tab. 6.c

Note: Screw compressors can only be configured on line 1 and the board must be dedicated only to line 1. One Bitzer CRII compressor can be configured for each line.

The compressor size refers to its capacity and number of load stages or to the inverter presence, therefore different sizes need to be defined for compressors with the same capacity yet a different number of load stages. The inverter is always associated to size 1.

Tutorial: below is one example of some possible configurations:

- One line, 4 reciprocating compressors with the same capacity, the first with inverter (2 sizes).
- One line, 4 scroll compressors with the same capacity, the first Digital Scroll[™] (1 sizes).
- One line, 4 reciprocating compressors with the same capacity, the first two with 4 load stages, the other two not capacity-controlled (2 sizes).
- One line, 4 reciprocating compressors with the same capacity and 4 load stages each (1 size).
- Two lines, line 1 with 2 screw compressors with the same capacity, the first with continuous modulation, line 2 with 4 reciprocating compressors with two different capacities, the first two with 4 load stages, the other two with 2 load stages (1 size on line 1, 2 sizes on line 2).
- Two lines, line 1 with 4 scroll compressors, the first Digital Scroll[™], line 2 with 4 reciprocating compressors, the first with inverter (1 size line 1, 2 sizes line 2).

6.3.2 Rotation

- pRack pR300 can manage 4 different types of device rotation:
- FIFO (First In First Out): the first device to start is also the first to stop
- LIFO (Last In First Out): the last device to start is the first to stop
- By time: the device with the least number of operating hours starts and the device with highest number of operating hours stops
- Custom: the on/off sequences are defined by the user

Note: Different Sizes of compressors can only be managed with Custom rotation.

The type of rotation is selected and the corresponding parameters set during the start-up procedure or in main menu branch C.a.f/C.b.f.

The activation thresholds are calculated differently depending on whether FIFO, LIFO, time or Custom rotation is used:

Device activation threshold calculation

Rotation Threshold calculation

FIFO	Static: the range of variation of the control request is divided equally
LIFO	between the number of stages available
By time	
Custom	Dynamic: the thresholds are calculated depending on the
	capacity effectively available
	Tab. 6.d

Example 1: FIFO rotation, 4 compressors of the same capacity without load stages.

The activation thresholds are 25, 50, 75 and 100 %.

Fig. 6.h

If an alarm is active on compressor 3, the recalculated activation thresholds are 10, 30, 70 %.

Activation of the compressors and load stages may be:

- Grouped (CpppCppp): first all the load stages are activated on one compressor before starting the next one
- Balanced (CCpppppp): first all the compressors are started at minimum capacity and then the corresponding load stages are activated, one for each compressor, in sequence.

6.3.3 Rotation with modulation devices

pRack pR300 can also manage compressor rotation when a capacity modulation device is fitted (inverter, Digital Scroll™ or continuous control).

The type of modulating device is selected and the corresponding parameters set during the start-up procedure or in main menu branch C.a.f/C.b.f and C.a.g/C.b.g

The modulating device is always the first to start and the last to stop irrespective of the type of rotation, the other devices start or stop according to the type of rotation selected.

Note: The compressor with modulation device is also assumed to be the first.

The trend in capacity delivered by the modulation device depends on the capacity of the compressor with the modulating device compared to the other compressors available.

Three cases can be identified:

- compressors all with the same capacity and range of capacity variation of the modulating device greater than or equal to the capacity of the compressors
- compressors all with the same capacity and range of capacity variation
 of the modulating device less than the capacity of the compressors
- compressors with different capacities

In the first case, the modulating device manages to continuously cover the range of variation of the control request, while in the second case some discontinuous variations remain. The behaviour in the third case varies according to the capacities involved, and in any case reflects one of the two previous cases.

To configure the compressor capacity when an inverter is used, the minimum and maximum operating frequencies need to be set relating to the minimum and maximum value of the analogue output and the rated capacity delivered at rated frequency (50 Hz), so that the pRack pR300 software can calculate the capacity the compressor can deliver with the inverter and use this value for control. In addition, for inverters the variation in capacity delivered can be limited by setting the increase and decrease times. If these times have already been configured on the inverter, the higher time set has priority.

Example 1: range of modulating device capacity variation higher than the capacity of the compressors:

two compressors without capacity control, with the same capacity, 20 kW each, modulating device with variable capacity between 30 and 60 kW. The figure shows the trend when the request sent by the controller increases and then decreases continuously between 0 and 100 %. It can be seen that the capacity delivered exactly follows the required capacity, except when below the minimum capacity of the modulating device.

Fig. 6.k

Example 2: range of modulating device capacity variation lower than the capacity of the compressors: two compressors without capacity control, with the same capacity, 30 kW each, modulating device with variable capacity between 20 and 40 kW.

It can be seen that the capacity delivered does not exactly follow the required capacity, rather acts in steps, so as to avoid swings.

Esempio 3: range of modulating device capacity variation in between the capacity of the compressors, all different sizes: two compressors without capacity control, capacities 15 kW and 25 kW, modulating device with variable capacity between 10 and 30 kW.

6.3.4 Starting

pRack pR300 can manage different types of compressor starting:

- Direct
- · Part-winding
- Star/delta

The type of starting can be selected and the related parameters set in main menu branch C.a.f/C.b.f.

For part-winding starting, the delay in activating the digital output that controls the second winding needs to be set:

For star/delta starting, the star time, the delay between the activation of the line and star digital input, and between the delta and star digital input all need to be set, as shown in the figure:

6.3.5 Safety times

pRack pR300 can manage common safety times for each compressor:

- Minimum on time
- Minimum off time
- Minimum time between consecutive starts

In addition, pRack pR300 can manage the specific times for Digital Scroll™ compressors and screw compressors; for the descriptions see paragraphs 6.3.10 and 6.3.11. The related parameters can be set in main menu branch C.a.f/C.b.f.

Note: for two lines, a further delay can be set between starts of the compressors on different lines, so as to avoid Simultaneous starts. See paragraph 6.6.6 for the detailed description of the synchronisation function for two lines (DSS).

6.3.6 Balancing

pRack pR300 can control any balance valves in parallel with the compressors.

This function can be used to activate a communicating solenoid valve between compressor suction and discharge, for a set time, before each individual compressor starts. In this way, the suction and discharge pressure can be balanced and the compressor can be started in more favourable conditions.

The balancing function can be enabled and the related activation time set in main menu branch C.a.f/C.b.f.

6.3.7 Economizer

pRack pR300 can activate the economizer function to boost compressor efficiency by injecting vapour. Some of the liquid is taken from the condenser, expanded through a valve and then sent to a heat exchanger to cool the liquid leaving the condenser. The resulting superheated vapour is injected into a special section of the compressor.

The function can be enabled and the related parameters set in main menu branch C.a.f.

The function can be enabled and the related parameters set in main menu branch C.a.f.

The economizer is only efficient for high compressor activation capacities, typically over 75 %, therefore the economizer function control valve is only activated when exceeding a set threshold.

As the economizer tends to increase the condensing pressure, this needs to be controlled to ensure the high condensing pressure alarm is not generated. In addition, the injection of vapour decreases the discharge temperature and so this value also needs to be monitored.

Consequently, the three conditions for activation of the economizer function are:

- Capacity above a set threshold
- Condensing pressure below a set threshold (with reset differential)
- Discharge temperature above a set threshold (with reset differential)

Note: the function can be activated on a maximum of 6 compressors.

6.3.8 Liquid injection

As an alternative to the economizer, pRack pR300 can manage the injection of liquid into the compressors (the two functions are alternative, as the point of vapour injection into the compressor is the same).

The function can be enabled and the related parameters set in main menu branch E.d.a.b/E.d.b.b.

Liquid injection is used to protect the compressor, and in fact decreases the discharge temperature.

Operation is Similar to the economizer function, with the difference that the expanded liquid is not sent to a heat exchanger, but rather directly into the compressor. The function is only activated when the compressor is on and the discharge temperature exceeds a set threshold (with differential).

Note: the function can be activated on a maximum of 6 compressors.

6.3.9 Manual operation

pRack pR300 can manage 3 different compressor manual operating modes:

- Enabling / disabling
- Manual management
- Output test

Enabling / disabling is managed in main menu branch C.a.f/C.b.f., while manual management and the output test can be activated in main menu branch B.b or B.c.

Enabling / disabling is used to temporarily exclude the compressors from operation, to allow, for example, repair or replacement. The disabled compressors are also excluded from rotation.

Note: enabling is the only compressor manual operating mode that can be activated when the unit is on.

Both manual management and the output test are enabled by parameter and remain active for a set time after the last button is pressed, after which the unit returns to normal operating mode.

Manual management is used to switch the compressors on or off without observing the control needs, however still considering any safety devices (alarms, safety times, starting procedures) and respecting the set configuration of the inputs/outputs.

The activation screen resembles the one shown in the figure and is used to override the outputs relating to the operation of the selected device, e.g. compressor 1:

Manual Mng.	86965
Digital output	boardi
COMPressor 1	
Force to:	OFF

The output test is used to activate or deactivate the outputs (where necessary setting an output percentage for the analogue outputs), without observing any type of safety feature.

The activation screen resembles the one shown in the figure and is used to override the outputs on the pRack boards, in the order they physically appear on the board (without links to the devices):

Test	DO		BCaiØ
Digi	tal	OUtPUt	boardi
DØ1		NO	OFF
DØS		NO	OFF

Important: manual mode and the output test can only be activated with the unit off.

Both manual mode and above all the output test must be used with special care and by expert personnel to avoid damage to the devices.

6.3.10 Digital Scroll[™] compressors

pRack pR300 can use a Digital Scroll™ compressorä as the modulating device for suction lines (one for each line). This type of compressor features special operation, and is controlled by pRack pR300 as follows. The related parameters can be set in main menu branch C.a.f/C.b.f. The capacity is modulated by opening/closing a valve with PWM; when the valve is ON the compressor delivers minimum capacity, while when the valve is off the compressor delivers maximum capacity. In the following description and figure, ON and OFF refer to the status of the compressor, while operation of the valve is the exact opposite:

The following data are provided by the manufacturer of the compressor:

- minimum ON time 2 s
- maximum cycle time 20 s
- optimum cycle time 12 s

There are three possible operating modes:

- Fixed cycle time
- Variable cycle timeOptimised cycle time
- Optimised cycle time

Based on the operating mode selected, pRack pR300 calculates the valve activation percentage that satisfies the required capacity.

Fixed cycle time

The compressor ON time is calculated as the percentage of the cycle time corresponding to the required capacity:

T_{on}= % Request * Cycle Time

The cycle time can be set to the optimum value suggested by the manufacturer to achieve maximum COP, or to a higher value to increase resolution of the capacity delivered (a higher cycle time implies greater continuity in the effective capacity that can be delivered).

Variable cycle time

The compressor ON time is set to 2 s and the cycle time is calculated based on the required capacity:

Optimised cycle time

The compressor ON time is set to 2 s and the cycle time is calculated based on the required capacity for capacities less than 17 %, after which the cycle time is set to 12 s and the ON time varies. In essence, this mode is a combination of the previous two. This guarantees the maximum possible COP and control rate (obtained with the 12 s cycle time) and the maximum control range (starting from 10 %).

O Note:

the minimum capacity that can be delivered by Digital Scroll™ compressors is Minimum ON time/Maximum cycle time = 2/30 = 6.7 %, which also depends on the selected control mode (for example, in the first case shown in the figure the minimum capacity delivered is Minimum ON time/Cycle time = 2/15 = 13%).

• if high pressure prevention is enabled with activation/deactivation of the devices, the Digital Scroll[™] compressor delivers the minimum possible capacity.

Starting procedure

pRack pR300 can manage the specific starting procedure for Digital Scroll $^{\rm M}$ compressors, as represented as in the following figure:

There are three stages:

- balance: the PWM valve is activated for 4 s, so that the compressor delivers minimum capacity;
- 2. compressor activation with 50 % capacity for 3 minutes;
- 3. forced operation at 100 % for 1 minute.

During the starting procedure, the request sent by the controller is ignored and only at the end of the procedure does the capacity delivered start reflecting the request. If the request is cancelled during the starting procedure, the compressor stops at the end, then the minimum ON time for these types of compressors is set to 244 s. The starting procedure is performed when the compressor is started, while it can be disabled for a set time by parameter for subsequent starts, if the compressor has not remained off for a minimum set time. After this time has elapsed the procedure is performed again during the following start.

Note: the safety times for Digital Scroll[™] compressors are established by the manufacturer, and are as follows:

- Minimum ON time: 244 s (starting procedure)
- Minimum OFF time: 180 s
- Minimum time between restarts: 360 s

Alarms

pRack pR300 can manage, in addition to the common alarms for all types of compressors (see chapter 8 for details), some specific alarms for Digital Scroll™ compressors:

- high oil temperature
- oil dilution
- high discharge temperature

These alarms are managed as specified by the manufacturer of the compressor, and therefore pRack pR300 can only enable or disable them. Activation of these alarms requires an oil temperature probe, which can also be the common probe (see the paragraph relating to oil management) and the compressor discharge temperature probe.

Note: pRack pR300 does not manages the envelope for Digital Scroll™ compressors and consequently there is no corresponding alarm when operating outside the envelope.

6.3.11 Screw compressors

pRack pR300 can manage up to two screw compressors, with control in stages or continuous control (only the first compressor with continuous control, used as modulation device for the suction line), which can be a generic device or pre-configured in accordance with the most common devices supplied by the main manufacturers. Advanced functions are also available, for example envelope control, described further on. The parameters relating to screw compressors can be set in main menu branch C.a.f/C.b.f. Screw compressors are fitted with up to 4 capacity control valves (hereinafter V1, V2, V3, V4), which can have 4 types of behaviour:

- • ON: the valve is open
- OFF: the valve is closed
- 🦉 Intermittent: the valve is open/closed alternatively (around 10 to 15 s)
- • Pulsating: the valve is open/closed alternatively with very short opening/closing times (around 1 to 2 s).

Important: pulsating valves must be associated with an SSR relay output, to avoid damage.

V1, V2, V3 and V4 can be managed to obtain stage or continuous compressor control.

Stage control

For the control in stages, normally involving four load stages, 25, 50, 75, 100 %, a table needs to be created that shows the behaviour of each valve in the different conditions (starting, 25 %, 50 %, 75 %, 100 %). The figure shows one possible example (see the documents supplied by the manufacturer of the compressor for how to complete the table):

	V1	V2	V3	V4
Start	0	0	0	0
Start 25%	0	•		0
50%		0		
50% 75%	0	0		0
100%	0	0	0	0
				Tab. 6.e

If intermittent valves are used, the cycle time also needs to be set.

Note: normally operation at minimum capacity (25 %) is only possible for a limited time, after which the compressor must switch to the next stage. This function can be enabled and the corresponding time can be set.

Continuous control

For continuous control, a table needs to be created that shows the behaviour of each valve in the different conditions (start/stop, increase, decrease, standby). The figure shows one possible example:

	V1	V2
Start/Stop	0	0
Increase (25 to 100%)	•	0
Decrease (25 to 100%)	۲	•
Standby	•	0
		Tah 6 f

If intermittent/pulsating valves are used, the cycle time also needs to be set. Intermittent valves are opened/closed for 50 % of the set time, while for pulsating valves the opening and closing time in theory depend on the difference between the position of the slide and the capacity request. As the position of the slide is generally not measurable, the variation in the request is used to calculate the times for pulsating valves.

Note: in continuous control, operation is normally only allowed for an undetermined time when the capacity exceeds 50 %.

Starting procedure

pRack pR300 can manage the starting procedure for the screw compressors by considering, following the star/delta or part-winding starting selected, a further time of operation at minimum capacity, established by the manufacturer or set to 60 s for generic compressors. Once the starting procedure has ended, the compressor starts varying the capacity according to the control request and if necessary considering the duration at minimum capacity.

Series of compressors supported

pRack pR300 can manage several series of screw compressors made by the main manufacturers, (Bitzer, Refcomp, Hanbell, ...) which come with the parameters described above already set.

The models managed by pRack pR300 are shown in the table:

Manufacturer Model

Bitzer	CSH6595, HS.53-4/64, HS.74, HS85
Hanbell	RC2-100/140/180, RC2-170/2001520
D. (C	134-S, 134-XS L1, 134-XS L2, SRS-S1XX755, SRC-S785985,
RefComp	SRC-XS L1, SRC-XS L2
	Tab. 6 g

For manufacturers or series of compressors that are not supported, the generic type can be used and the corresponding parameters set as described previously.

Note: for further details on the series of compressors supported and the related pre-configured parameters, contact Carel.

Envelope

For screw compressors, pRack pR300 can manage control of the envelope, which can either be pre-set or defined by the user. pRack pR300 accepts the envelope control settings for the Bitzer CSH series compressors, and these simply need to be enabled in main menu branch C.a.g.

For all other series of compressors, the envelope can be managed by enabling and setting all the related parameters in main menu branch C.a.g.

The following parameters need to be set in order to manage the envelope:

- Definition of the points (maximum 30)
- Definition of the zone (maximum 12). Each zone can be made up of one or more polygons (total maximum 14, which must be closed and convex)
- Definition of the behaviour of the compressor in the different zones (capacity and duration)

The meaning of the parameters is shown in the figure:

pRack pR300 can also manage the variation in the envelope as the capacity delivered changes, for example in the case of variation in frequency for inverter-driven compressors.

Note: for further details on configuration of the envelope, contact Carel.

6.3.12 Bitzer CRII modulating compressor

pR300 can manage a system fitted with CRII compressors. Up to 2 CRII compressors can be configured (one on each line), each as first compressor in L1 and L2.

CRII is set as a capacity controlled piston compressor in which the capacity steps can be activated/deactivated rapidly (5 s). In addition, the CRII compressor can be ON with the capacity steps deactivated, so as to respond faster to demand. This condition can remain active for a maximum set time, after which capacity control will be activated, in turn for a set time, to prevent compressor malfunctions.

Compressor capacity control is achieved by valves managed using SSR digital outputs, due to the high number of cycles involved. Up to 3 capacity steps can be configured on for each line (check the number of SSRs available).

Management by the pR300 of the different capacity steps allows complete compressor capacity modulation.

Capacity-control activation/deactivation

Capacity-control refers to the valve installed on the compressor. For 2 capacity steps, the compressor will be fitted with 2 valves and pRack needs to manage 2 SSR digital outputs. Capacity-control activation/ deactivation refers then to energising/de-energising the valve, so as to open or close the flow of refrigerant. A step is activated when demand exceeds the corresponding capacity, vice-versa it is deactivated when demand falls to the lower step. The following figure represents an example of a CRII with 2 capacity steps (50-100). The first steps is activated as soon as demand exceeds 50%, and the second when reaching 100%. When demand falls, on the other hand, the second step is deactivated as soon as this falls below 50%, and the first at 0%.

<u>CAREL</u>

CRII modulation in neutral zone

The type of control can be selected between proportional-integral and neutral zone. If choosing neutral zone control, CRII compressor modulation can be enabled inside the zone. CRII modulation requires the definition of a new band, comprising the set point and a differential called "Diff CRII", this band defined must fall inside the neutral zone.

Comp.Re Neutral	gul. zone	Cables Manage
NZ diff. Activ.di Deact.di	; ff::	0.3bar9 0.7bar9 0.7bar9
NZ diff.	CRII	0.2barg

<u>CASE 1:</u> suction pressure is inside the neutral zone and is increasing. Starting from current capacity, at the moment when "min mod" is exceeded, the compressor will activate the capacity steps until reaching "max mod" at 100%.

<u>CASE 2:</u> suction pressure is inside the neutral zone and is decreasing. Starting from current capacity, at the moment when "min mod" is exceeded, the compressor will deactivate the capacity steps until reaching "max mod" at 0%.

 MAX mod. = actual capacity C MIN mod. = 0% of CRII

Total capacity doesn't change

In both cases, in the grey area between the neutral zone thresholds and the CRII differentials, total capacity does not change.

Note: when the suction pressure falls outside of the neutral zone, the compressors are switched off in sequence, varying CRII capacity to achieve correct modulation. The CRII compressor will go to 0% capacity before another compressor is shut down, and can remain in this condition for a set time, as long as there are other active compressors. If it is the last compressor active at that moment, after reaching 0% capacity it will immediately shut down.

Comp.Config. (CRII Compressor	Caf 88
Max time at 0%:	60s
Force comp.to min after max time: Max.force on time:	Step YES 60s

Configuration

A system with CRII compressors can be configured directly from the wizard. The following procedure shows the selection of a CRII compressor with two capacity steps, 50%-100%:

Mittend Comeressor Modulate s device: (Only for comeressor	Peed BITZER CRII first

Comp.Config. Compressor control by CR2, timings	led
Min on time: Min off time: Min time to start	30s 60s
same compressor:	180s

Max time with compressor on with load bypassed is the maximum time in which the CRII compressor can remain active at 0% capacity after which capacity control will be activated.

• up to 120 s

CRII Compressor	16688
Max time at 0%:	60s
Force comp.to min after max time: Max.force on time:	Step YES 60s

CRII unloader delay is the delay on activation of capacity control. • range [5 s ... 999 s]

Extra cooling fan

To prevent malfunctions of the CRII compressor due to high operating temperature, pR300 can activate a fan installed on the compressor to provide extra cooling. pR300 does not manage the CRII compressor envelope. The extra cooling fan is activated based on two variables:

- Current CRII capacity
- Condensing pressure

with specific cases for the medium temperature and low temperature line.

ENG

Fan for medium temperature line

- The following parameters need to be set to manage the fan:
- Condensing pressure threshold (default 16 bars)
- Shutdown evaluation time with pressure higher than threshold(default 180 s)
- Shutdown evaluation time with pressure lower than threshold(default 60 s)
- Shutdown delay (default 20 s)

The following table highlights the cases in which the fan is activated with reference to the default values:

Condensing	CRII % activation (*)	Fan
pressure (Pcond)		
Pcond >= 16bar	50% → 0%	Switch on
Pcond < 16bar	50% → 0%	Keep off or switch off after 0s + 20s
Pcond >= 16bar	0%	Keep on
Pcond < 16bar	0%	Keep off or switch off after 60 s + 20s
Pcond >= 16bar	50%	Keep off or switch off after 180 s + 20 s
Pcond < 16bar	50%	Keep off or switch off after 60 s + 20 s

Fan for low temperature line

The following parameters need to be set to manage the fan:

- Condensing pressure threshold P1 (default 7.5 bars) didepending on the capacity step
- Condensing pressure threshold P2 (default 15 bars) didepending on the capacity step
- Condensing pressure threshold P3 (default 19.5 bars) didepending on the capacity step
- Shutdown evaluation time with pressure higher than threshold(default 180 s)
- Shutdown evaluation time with pressure lower than threshold(default 60 s)
- Shutdown delay (default 20 s)

The following table highlights the cases in which the fan is activated with reference to the default values, with 3 capacity steps:

Condensing pressure (Pcond)	CRII % activation (*)	Fan activation
Pcond <p1 (condi-<="" td=""><td></td><td>Keep off or switch off after 0s + 20s</td></p1>		Keep off or switch off after 0s + 20s
tion not allowed)		
P1<=Pcond <p2< td=""><td>step1 → 0%</td><td>Switch on</td></p2<>	step1 → 0%	Switch on
P2<=Pcond <p3< td=""><td>step1 → 0%</td><td>Switch on</td></p3<>	step1 → 0%	Switch on
Pcond>=P3	step1 → 0%	Switch on

P2<=Pcond <p3< td=""><td>step3</td><td>Keep off or switch off after 180 s + 20s</td></p3<>	step3	Keep off or switch off after 180 s + 20s
Pcond>=P3	step3	Switch on

6.4 Fans

pRack pR300 can manage up to 2 condenser lines with up to 16 fans and one speed modulation device each, applying common types of device rotation and controlling both the starting mode and some accessory functions. The modulation device may be an inverter or a phase fired controller. The fan functions and related parameter settings are enabled from main menu branch D.a/D.b. The functions are described in detail below.

6.4.1 Control

pRack pR300 can manage - as described in paragraph 6.2 - proportional band and Neutral zone control, by pressure or temperature. For details on the control modes, see the corresponding paragraph, while below is the description only of the features relating to the fans.

Fan operation depending on the compressors

The operation of the fans can be bound to the operation of the compressors by setting a parameter in main menu branch D.a.b/D.b.b, in this case the fans only start if at least one compressor is on. This setting is ignored if the fans are controlled by a dedicated pRack pR300 board and the pLAN network is disconnected.

Fan operation with modulating device

If the fans are controlled by a modulating device, the meaning of the parameters that associate the minimum and maximum values of the device's modulating output and the minimum and maximum capacity of the modulating device on screens Dag02 and Dbg02 is illustrated in the following examples.

Example 1: minimum modulating output value 0 V, maximum value 10 V, minimum modulating device capacity 0 %, maximum 100 %.

Example 2: minimum modulating output value 0 V, maximum value 10 V, minimum modulating device capacity 60 %, maximum 100 %.

Fig. 6.t

Example 3: minimum modulating output value 2 V, maximum value 10 V, minimum modulating device capacity 60 %, maximum 100 %.

Cut-off

pRack pR300 manages a control cut-off for the fans; functions and related parameter settings can be enabled from main menu branch D.a.b/D.b.b. The operating principle of the cut-off function is shown in the figure:

Fig. 6.v

A percentage of the control request and a cut-off set point can be set. When the control request reaches the set cut-off value, this value is kept constant until the control value falls below the cut-off set point, after which it falls to 0 % and remains there until the request exceeds the cutoff value again.

6.4.2 Rotation

pRack pR300 can manage rotation of the fans, much in the same way as described for the compressors, therefore:

- LIFO, FIFO, time, Custom rotation
- Management of a modulation device on each line

The substantial difference compared to the compressors concerns the possibility to manage different capacities and load stages, which are obviously not featured for the fans. In addition, pRack pR300 can specially manage inverter driven fans. In fact, a multiple number of inverter driven fans can be set.

If there is more than one fan, however the number of inverter driven fans is set to 1, the fans are started and stopped at the same time, and the fans will always all be at the same power.

If there is more than one inverter driven fan, as well as being able to use an alarm digital input for each, it is assumed that the weight of the modulating device is proportional to the number of fans, therefore the first case is applied, as described in paragraph 6.3.3: fans all with the same power and modulating device power variation range greater than or equal to the capacity of the other devices.

Example 1: 4 fans all controlled by the same inverter correspond to 1 fan with four times the power.

Note: some fans can be excluded from the rotation, for example in the winter; to do this use the split condenser function described in paragraph 6.4.5.

6.4.3 Fast start (speed up)

pRack pR300 can manage the fast start function (speed up), used to overcome the initial inertia of the fans.

The function can be enabled and the related parameters set in main menu branch $\mbox{D.a.g}/\mbox{D.b.g}$

If speed up is enabled, a start time can be set in which the fan speed is forced to 100%. If the outside temperature sensor is used, moreover, a threshold can be set (with reset differential) below which speed up is disabled, so as to not drastically lower the condensing pressure at start-up.

Note: speed up has lower priority than the Silencer function (see the following paragraph for the details), therefore if the Silencer function is active, this is disabled.

6.4.4 Silencer

pRack pR300 can manage the Silencer function, used to limit fan speed at certain times of the day or in specific conditions, enabled by digital input. The function can be enabled and the related parameters set in main menu branch D.a.g/D.b.g.

Enabling fan speed limitation from the digital input or based on time bands is independent, consequently the speed is limited to the set value when at least one of the two conditions is active.

Up to 4 activation bands can be set for each day of the week.

6.4.5 Split condenser

pRack pR300 can manage the possibility to exclude some fans from operation, for example to reduce condenser operation in winter, using the split condenser function.

The function can be enabled and the related parameters set in main menu branch D.a.g/D.b.g.

Split condenser can be used to exclude from rotation fans whose index is: • even

- odd
- higher than a settable value
- lower than a settable value

The function can be activated by:

- time bands (winter/summer seasons)
- digital input
- supervisor
- outside temperature (set threshold and differential)

D Note:

- the split condenser function can be disabled by parameter if the high pressure prevention function is activated (see paragraph 8.3.3). If split condenser is disabled due to activation of the high pressure prevention function, it remains disabled for a set time, after which it is reactivated.
- split condenser cannot be enabled if there is a speed modulation device that controls all the fans.

6.4.6 Manual operation

pRack pR300 can also manage the same three manual operating modes for the fans as described for the compressors:

- Enabling
- Manual management
- Output test

Enabling is managed in main menu branch D.a.f/D.b.f., while manual management and the output test can be activated in main menu branch B.b or B.c. For the detailed description of the three modes, see paragraph 6.3.9.

6.4.7 Alarms

 ${\sf pRack}\,{\sf pR300}$ can manage both a common alarm for the fans and separate alarms for each fan.

When the common alarm is active the alarm is signalled, but no fan is stopped, while for separate alarms the fan that the alarm refers to is stopped. For details on the fan alarms, see Chapter 8.

6.5 Energy saving

pRack pR300 can activate energy saving functions by adjusting the suction and condensing pressure set points.

The suction and condensing pressure set points can be applied with two different offsets, one for the closing period and one for the winter period, activated by:

- Digital input
- Time band
- Supervisor

In addition, the suction pressure set point can be modified from analogue input, applying a linearly variable offset based on the value read by a probe.

As well as set point compensation from digital input, scheduler, supervisor or analogue input, two further energy saving functions are available, floating suction and condensing pressure set point.

The functions can be enabled and the related parameters set in main menu branch C.a.d/C.b.d and D.a.d/D.b.d.

6.5.1 Set point compensation

Compensation from digital input, scheduler or supervisor is similar for the suction and condensing pressure set points, consequently the following description applies to both.

Two different offsets can be defined, which apply to:

- Closing periods, defined by the scheduler, activation of a digital input or supervisor
- Winter period, defined by the scheduler

The two offsets add to the set point defined by the user when the corresponding condition is active.

Example 1: closing offset 0.3 barg, winter offset 0.2 barg, suction pressure compensation from scheduler and from digital input activated. When the digital input is activated, for example with a day/ night function, 0.3 barg is added to the operating set point, and when the winter period is in progress a further 0.2 barg is added. The operation can be schematised in the following figure:

Note: the same digital input is used for set point compensation on each line, so if suction and condensing pressure set point compensation is activated by digital input, both compensation functions are active at the same time.

Compensation from analogue input only applies to the suction pressure set point and can be enabled separately. If compensation from analogue input is enabled, a offset that is linearly variable to the value read by a dedicated probe can be applied to the suction pressure set point, as shown in the figure.

6.5.2 Floating suction pressure set point

For the suction line, the floating set point is managed by the supervisor. The suction pressure set point set by the user is changed by the supervisor in range between a settable minimum and maximum. The operation is illustrated in the following figure:

The set point is calculated by the supervisor and acquired by the pRack pR300 controller at set intervals, the maximum variation allowed for the set point in each sampling period can also be set; if the value acquired differs from the previous value by more than the maximum variation allowed, the variation is limited to the maximum value. If the supervisor is disconnected, after 10 minutes (fixed) the pRack pR300 controller starts decreasing the set point with variations equal to the maximum variation allowed each sampling period, until reaching the minimum set point allowed with floating suction pressure.

Note: if set point compensation from scheduler, digital input or supervisor is also active, the offset is added to the minimum and maximum limits for the floating set point.

6.5.3 Floating condensing pressure set point

For the condenser line, the floating set point is based on the outside temperature. The floating condensing pressure set point is achieved by adding a constant programmable value to the outside temperature and limiting the resulting value between a settable minimum and maximum, as shown in the figure:

Note: if set point compensation from scheduler, digital input or supervisor is also active, the offset is added to the minimum and maximum limits for the floating set point.

6.6 Accessory functions

pRack pR300 can manage several accessory functions. Of these, the economizer and liquid injection have already been described in paragraph 6.3 on compressor operation, while the others are described below.

6.6.1 Oil management

pRack pR300 features oil management for the individual compressors, as well as common management for each line:

- Individual compressor: oil alarm, high oil temperature, and, for screw compressors only, oil warning, oil cooling and oil level
- Line: common oil alarm, high oil temperature warning, oil cooling

The function can be enabled and the related parameters set in main menu branch E.a.a/E.a.b or C.a.e/C.b.e (for the individual compressor alarms).

Individual compressor oil management

For the description of the oil alarm and warning corresponding to the individual compressor see Chapter 8. For screw compressors, an oil cooler can be managed for each compressor, made up of a heat exchanger, a fan and 1 or 2 pumps. The operation of the cooler varies according to the setting of the output, which may be:

- Analogue: one pump only
- Digital: 1 or 2 pumps

The control probe is the compressor oil temperature probe, and the following need to be set: set point, differential and, for 2 pumps only, an activation delay for the second pump. The operation of the cooler when using an analogue output is shown in the figure:

If a digital output and just one pump is used, the fan and the pump are activated/deactivated at the same time:

Fig. 6.ab

If a digital output and two pumps are used, the operation of the fan and the first pump is Similar to the previous case, while the second pump is activated when the oil temperature is greater than the set point + differential for a time at least equal to the delay, and is deactivated when the oil temperature falls back below the set point minus the differential. The oil level can be managed for the first 6 compressors on each suction line. If a compressor alarm is configured as an oil alarm, this alarm can be associated with oil level management, enabling the function and setting the compressor alarm number to be used: when the digital input associated with the alarm is activated (this thus Signals the low oil level), a valve is activated with intermittent operation to restore the level, with opening and closing times that can be set. If after a set time, the digital input is still active, that is, the minimum level has not been reached, pRack pR300 Signals an alarm and stops the compressor.

Line oil management

pRack pR300 features an alarm digital input for each line; this is with Signal only, that is, has no effect on the operation of the devices. For details on this alarm see chapter 8.

For all types of compressors, a common oil cooler can be managed for each line; the operation of this is Similar to the cooler for each individual compressor described previously.

Note: for screw compressors, if common cooling is selected, cooling for each compressor cannot be activated.

6.6.2 Subcooling

- pRack pR300 can control subcooling in two different ways:
- · with the condensing temperature and the liquid temperature
- with the liquid temperature only

In the first case, subcooling is calculated as the difference between the condensing temperature (obtained by converting the condensing pressure) and the liquid temperature measured after the exchanger. The corresponding output is activated below a set threshold, with fixed differential.

In the second case, the output is active for liquid temperature values greater than a threshold, with fixed differential.

The subcooling function can be enabled and the related parameters set in main menu branch E.b.a/E.b.b.

Note: the subcooling function is active when at least one compressor is on.

6.6.3 **Heat recovery**

pRack pR300 can manage heat recovery for types of system with heat recovery in series with the main condenser.

Heat recovery can be activated by:

- Probe
- Time bands
- Supervisor

The heat recovery function can be enabled and the related parameters set in main menu branch E.e.a/E.e.b.

A digital input is managed that acts as a trigger for activating the function. When the digital input is not active, heat recovery is not operating, while when the digital input is active heat recovery is operating when at least one of the other conditions is true, as shown in the figure:

If the digital input is not configured, only the other conditions are taken into consideration.

When the heat recovery function is active, a digital output is activated to trigger the pump and a digital or analogue output for an On/Off or modulating 3-way valve.

For activation by probe, the operation of the On/Off or modulating 3-way valve and the pump is shown in the figure, where the temperature considered is the heat recovery exchanger outlet temperature:

If the probe is not working, pRack pR300 considers the other conditions, without Signalling further alarms in addition to the probe alarm. As regards activation from time bands, heat recovery does not consider the operating seasons, and links can be set to special days and closing periods so that heat recovery is only active based on the daily bands set.

Note:

- a settable bottom limit is available for the condensing pressure, below which heat recovery is deactivated.
- condensing pressure set point compensation can be disabled when heat recovery is active..

Heat recovery as the first stage in high pressure prevention

Heat recovery can be used to prevent high condensing pressure. The parameters relating to this function can be set in branch G.b.a/G.b.b of the main menu, after having enabled the heat recovery function. For details on operation of the prevent function, see paragraph 8.3.3. Heat recovery operation as the first stage in high pressure prevention is shown in the figure:

The function must be enabled and an offset must be set in relation to prevent threshold, while the differential is the same set for the prevent function.

6.6.4 Generic functions

pRack pR300 can use the free inputs /outputs and certain internal variables for generic functions.

Important: The generic functions are available on pRack pR300 boards with pLAN addresses from 1 to 4, that is, on all boards that manage a suction or condensing line, nonetheless only the parameters corresponding to the functions managed by boards 1 and 2 are sent to the supervisory system.

The following generic functions are available for each board:

- 5 stages
- 2 modulations
- 2 alarms
 1 schodula
- 1 scheduler

Each function can be enabled/disabled by digital input and from the user interface.

The generic functions can be enabled and the related parameters set in main menu branch E.f. To be able to use the free inputs, these must be configured as generic probes from A to E (analogue inputs) and generic inputs from F to J (digital inputs), consequently a maximum of 5 analogue and 5 digital inputs can be used. After having configured the generic probes, the associated variables can be used as control variables and the digital inputs as enabling variables.

As well as the generic probes and inputs, pRack pR300 software internal variables can be used, depending on the system configuration. Some examples are, for analogue variables:

- Suction pressure
- Condensing pressure
- Saturated suction temperature
- Saturated condensing temperature
- Suction temperature
- Discharge temperature
- % of compressors active
- % of fans active
- Superheat
- Subcooling
- Liquid temperature,
- % compressor request% fan requesti

And for the digital variables:

- High suction pressure alarm
- Low suction pressure alarm
- High condensing pressure alarm
- Sign of life
- Prevent active

Each generic function can be associated with a unit of measure and a description. Below is a description of the operation of four types of generic functions.

Stages

pRack pR300 can manage up to 5 stage functions, with either direct or reverse operation. In both cases, a set point and a differential can be set; the operation of the corresponding output is shown in the figure for both cases:

Fig. 6.ah

If an enabling variable has been set, the corresponding output is active if the enabling is also active.

For each stage, a high alarm threshold and a low alarm threshold can be set, and are absolute. For each alarm, the activation delay and priority can be set. See chapter 8 for details on the alarms.

One example of using the generic stage functions may be activation of the fans on the room units based on the temperature.

<u>CAREL</u>

Modulation

pRack pR300 can manage up to 2 modulation functions, with either direct or reverse operation. In both cases, a set point and a differential can be set; the operation of the corresponding output is shown in the figure for direct mode, with the cut-off function also enabled:

If an enabling variable has been set, the corresponding output is active if the enabling is also active. For each modulation, a high alarm threshold and a low alarm threshold can be set, and are absolute. For each alarm, the activation delay and priority can be set. See chapter 8 for details on the alarms. For modulation a minimum and maximum value can also be set for the output, and the cut-off function can be enabled, with operation as shown in the previous figure.

Alarms

pRack pR300 can manage up to 2 alarm functions, with settable digital variable to be monitored, activation delay, priority and description. Each generic function can be associated with a digital output for the activation of external devices when the alarm is activated. One example of using the generic alarm functions involves detecting gas leaks.

Scheduler

pRack pR300 can manager a generic scheduler that activates a digital output at certain time bands. Up to 4 daily time bands can be set for each day of the week, in addition operation of the generic scheduler can be linked to the common scheduler, and consequently the output activated based on:

- summer/winter
- up to 5 closing periods
- up to 10 special days

See paragraph 6.7.2 for details on the time bands.

6.6.5 ChillBooster

pRack pR300 can control the Carel ChillBooster, device used for evaporative cooling of the air that flows through the condenser. ChillBooster can be enabled and the related parameters set in main menu branch E.g. ChillBooster is activated when two conditions exist:

- the outside temperature exceeds a set threshold
- the fan control request is at the maximum for at least a settable number of minutes

The maximum request time starts counting again whenever the request decreases, therefore the request must remain at the maximum for at least the set time. Activation ends when the request falls below a set threshold. pRack pR300 can manage an alarm digital input from ChillBooster, the effect of which is to deactivate the device. For details see Chapter 8. As the number of operating hours of ChillBooster is critical as regards formation of scale on the condenser, pRack pR300 can manage the operating hour threshold, which should be set to 200 hours.

Hygiene procedure

To avoid water stagnation in the pipes, a hygiene procedure can be enabled that activates ChillBooster every day for a set time, if the outside temperature is greater than a threshold.

Note: if the outside temperature probe is not configured or is configured but is not working, ChillBooster operates based solely on the control request, and the hygiene procedure can still be activated.

The only difference between probe not configured and probe not working concerns the ChillBooster operating without temperature probe alarm, which is only generated when the probe is configured but not working.

ChillBooster as the first stage in high pressure prevention

ChillBooster can be used to prevent high condensing pressure.

The parameters relating to this function can be set in branch G.b.a/G.b.b in the main menu, after having enabled the ChillBooster function.

For details on the prevent function see paragraph 8.3.3.

Operation of ChillBooster as the first stage in high pressure prevention is Similar to the heat recovery function described in paragraph 6.6.3.

The function must be enabled and an offset must be set in relation to the prevent threshold, while the differential is the same as set for the prevent function.

6.6.6 Double line synchronisation (DSS)

pRack pR300 can manage, for two line configurations, several synchronisation functions between the two lines:

- Disable simultaneous compressors starts
- Force the medium temperature line on if the low temperature line is activated
- Shutdown the low temperature line if the medium temperature line has a serious alarm
- Enable pump-down medium temperature line

The four DSS functions can be enabled independently and are useful for booster or CO2 cascade system configurations:

Important: in the pRack pR300 software assumes that the medium temperature line is line L1, while the low temperature line is line L2.

DSS can be enabled and the related parameters set in main menu branch E.h.

ENG

Disable simultaneous starts

Disabling simultaneous compressor starts may be useful for all system configurations with two separate lines and in cascade system configurations. The function to avoid simultaneous starts can be enabled, setting a delay time between the starts of compressors on different lines.

Forcing the medium temperature line

Forcing the medium temperature line may be useful for cascade system configurations and involves, once enabled, forcing at least one compressor on medium temperature line L1 to start at minimum capacity, if at least one compressor on low temperature line L2 is running. This means that before the low temperature line starts, the DSS function forces at least one of the compressors on medium temperature line L1 to start. The low temperature line L2 thus has higher priority than the control request for medium temperature line L1.

Shutdown the low temperature line

The low temperature line is shutdown by the DSS function if a serious alarm is activated on the medium temperature line, or, in general, if the medium temperature line is OFF.

Enable pump-down medium temperature line

During normal compressor rack operation, when at least one compressor on the low temperature line is running, the medium temperature compressor control will enable pump-down. If there is demand on the low temperature line, the minimum capacity step for medium temperature line will be guaranteed if MT suction pressure is not lower the set threshold.

Note: in the event of pLAN network faults, DSS is disabled.

6.6.7 Electronic valve synchronisation (EVS)

For configuration of the DRIVER or DRIVERS, where there are two heat exchangers, access OTHER FUNCTIONS \rightarrow EVS; iwhich comprises the following submenus:

- a. Temperature control
- b. Manual management
- c. I/O status
- d. Control

e. Valve configuration f. Driver configuration

Temp. control: Information relating superheat is shown Manual management: The valve can be moved to a certain number of steps I/O status: Display and configuration of the probes connected to the 4 analogue inputs on the driver Control: Valve opening, PID parameters, alarm limits/delays Valve configuration: Minimum/maximum number of steps, nominal frequencies Driver configuration: Enable driver, defaults

For branches a, b, c, d, e, f refer directly to the parameter table in chapter 7, while for a more detailed explanation of the DRIVER EVD EVO functions, see the technical manual: +0300005EN

Note: one DRIVER is needed for each valve; if a Twin Driver is used, this will be managed as a single driver; also the connection must be made on the first valve (EXV1-J27 in the case of built-in drivers).

Enable driver:

The driver can be enabled in the configuration menu (E.i.f) and once enabled, the number of valves and corresponding addresses of the two drivers can be entered.

119. 0.05

The Driver is enabled automatically when the system selected in the Wizard is either "Cascade" or "Pumped".

Note:

- make sure that Fieldbus driver management reflects the logic of the generic functions, i.e. up to 2 drivers per suction line can be enabled, with a limit of 2 drivers per board in the pLAN (L1&L2 on single board, maximum 2 drivers);
- on the supervisor, L1, L2 management on separate boards requires the use of two single line templates;
- a Fieldbus driver cannot be connected to boards 3 and 4 in pLAN.

Screen Eif02 contains the commands to set the defaults for the Driver, after which the parameters are updated (pRack→Driver),); in addition, the line of compressors used for the pre-positioning logic can be selected.

Note:

- Control based on line 1 is only possible on pLAN board with address 1. While control based on the compressors on line 2 is only possible on boards where the low temperature compressors are configured (pLAN 1 for double suction on single board and pLAN2 for double suction on separate boards);
- important, if the line is not managed o the current board, the Driver function is disabled.

COMMON varying cooling capacity

Pre-positioning/start control: if switching from standby to control, before actual control starts the valve is moved to a specific initial position. The pre-positioning time is the time in which the valve is kept in a fixed position, according to the parameter "Valve opening at start-up".

Parameter/Description	Def.	Min.	Max.	UOM
CONTROL				
Pre-positioning time	6	0	18000	S
Valve opening at start-up	50	0	100	%
(evaporator /valve capacity ratio)				
				T 1 4 1

Tab. 6.i

The valve opening parameter should be set based on the ratio between rated evaporator and valve cooling capacity (e.g. rated evaporator cooling capacity: 3 kW, rated valve cooling capacity: 10 kW, valve opening = 3/10 = 33%).

- If 100% capacity is required: Opening (%)= (Valve opening at start-up);
- If capacity required is less than 100% (capacity control): Opening (%)= (Valve opening at start-up) • (Current unit cooling capacity), where the current unit cooling capacity is sent to the driver via pLAN by the pCO controller. For stand-alone drivers this is always equal to 100%.

Note:

- this procedure is used to anticipate valve movement and bring it much closer to working position immediately after the unit is powered on;
- if there are problems with liquid return after the start of the refrigeration unit, or there are frequent unit on-off cycles, valve opening at start-up must be decreased. If there are low pressure problems after starting the refrigeration unit, the valve opening must be increased.

Positioning (change cooling capacity)

In practice, the valve is re-positioned starting from the current position in proportion to how much the unit cooling capacity has increased or decreased, in percentage terms. On reaching the calculated position, irrespective of how long it takes (variable according to the type of valve and the actual position), there will be a constant 5 second delay, after which control resumes.

Note: if it is not possible to have the information on the change in unit cooling capacity, this will be always be considered as operating at 100% and therefore the procedure will never be used. In this case, the PID control needs to be more reactive (see Control), so as to respond promptly to variations in load that are not communicated to the driver.

Legenda:

A	Control request	T3	Re-positioning time	
С	Change in capacity	W	Wait	
NP	Re-positioning	t	Time	
R	Control			

6.6.8 Unit of measure

pRack pR300 can manage two units of measure, the international system and Imperial.

Note: the temperature and pressure units of measure can be changed from °C, barg to °F, psig only during start-up; mixed configurations are not allowed, for example °F and barg.

6.6.9 Sign of life

pRack pR300 can manage a digital output acting as a sign of life, activated when pRack pR300 is powered up.

This output remains active while the controller is working correctly and highlights any hardware faults.

The Signal can be configured in main menu branch B.a.c.

6.6.10 Liquid non-return

pRack pR300 can manage a digital output with the meaning of liquid non-return. This normally active output is deactivated when all the compressors are off and no compressor can be started due to alarms or time settings, despite the control request, or when the unit is OFF. As soon as at least one compressor is enabled to start, the output is deactivated, allowing management of a liquid non-return valve. The function can be configured in main menu branch C.a.g/C.b.g.

6.6.11 Interaction with pLoads

pRack pR300 can interact with the pLoads controller, which manages power using a load cut-off function.

Interaction can be enabled and the related parameters set from main menu branch C.a.d and C.b.d.

Interaction between pRack pR300 and pLoads uses digital inputs or the supervisor. The digital inputs have higher priority, therefore if a digital input is not active, the corresponding action is not produced even if requested by the supervisor.

Two of the free digital inputs on pRack pR300 can be configured for connection to two pLoads outputs, with each input being assigned one of the following actions:

- No action. Activation of the digital input has no influence on control.
- Capacity limited to the current value. Activation of the digital input limits the maximum control request; capacity can be reduced from this value by the controller, but cannot exceed the current value at the moment the digital input was activated for the entire time it remains active, as shown in the figure:

- Capacity limited to a % value, settable by parameter. As in the previous case, the control request is limited at the top end, however to a fixed value set by parameter.
- Decrease capacity by a % value, settable by parameter. Activation of the digital input reduces the control request by a fixed value set by parameter, as shown in the figure:

• By suitably setting this parameter based on system configuration, one compressor can be shut down; for example if there are three compressors, by setting the decrease to 33%, activation of the input stops one of the three compressors. Compressor shutdown and restart respect the safety times.

The digital inputs configured are common to both lines, while for each line a different action can be associated with the same digital input.

In any case, the previous actions do not interfere with the pRack pR300 safety features, which always have priority over the actions set from digital input.

Moreover, a suction pressure safety threshold has been introduced, therefore the actions associated with the inputs are only enabled if the pressure does not exceed this threshold (settable by parameter). After the pLoads action has been disabled, it is necessary that the suction pressure returns below the safety threshold for a setted time (higher than 30 s), before restoring the interaction between the two devices, so to the regulation can be stabilize.

6.6.12 Power consumption

pRack pR300 can calculate power consumption for the current day and the previous day. The calculation can be enabled and the related parameters set from main menu branch C.a.d and C.b.d.

To calculate power consumption, the current draw is measured via an analogue input, while the type of load, rated voltage and displacement can be set by parameter. The calculation starts at 00:00 every day and continues until 24:00, when the value from the previous day is overwritten with the new calculated value. The supervisory system can use the two values, current day's consumption and previous day's consumption, for power consumption analysis.

6.7 Settings

6.7.1 Clock

pRack pR300 features an internal clock with backup battery that keeps the time and date for all related functions (see Chapter 2 for details relating to the hardware).

The date on pRack pR300 can be set as follows:

- day, month, year (dd/mm/yy)
- month, day, year (mm/dd/yy)
- year, month, day (yy/mm/dd)

The current date and time can be set, the day of the week corresponding to set date displayed, plus changeover to daylight saving can be enabled by setting the changeover date and the deviation.

The related parameters can be set during start-up or in main menu branch F.a.

Note: the date and time are managed on pRack boards with addresses 1 and 2; on power-up and whenever the pLAN network is reconnected, the software on pRack synchronises the settings on board 2, sending the date and time set on board 1.

If the clock card is not operating, an alarm is generated and the functions relating to the time bands described in the following paragraph are not available.

6.7.2 Time bands

pRack pR300 allows the operating seasons, the closing periods and weekends to only be set once, and consequently these are common to all the system functions.

As well as these settings, each function can be associated with a weekly scheduler, setting up to 4 different daily activation bands for each day of the week. For each time band, the start and end time can be set and settings made can be copied to the others days of the week.

The priority of the schedulers, from lowest to highest, is:

- weekly scheduler
- closing periods
- special days

For example, if the weekly scheduler requires activation of a function, yet a closing period is in progress, and requires deactivation of the same function, then the function is deactivated. The following functions allow the setting of time bands:

- Split-condenser: the function is active only based on the operating seasons, and consequently special days, closing periods and daily time bands are ignored.
- Silencer: the function is only active with daily time bands, there is no link to operating seasons, special days and closing periods
- Heat recovery: the function is active with daily time bands, special days and closing periods, no link to operating seasons. The link to the general scheduler can be disabled, considering the time bands only.
- Set point compensation: active with operating seasons, special days, closing periods and daily time bands (two different offsets).

• Generic functions: the generic scheduling function is active with the operating seasons, special days, closing periods and daily time bands. Operation of the generic functions can be separated from the generic scheduler, considering the daily time bands only.

For details on the functions that use time bands, see the corresponding paragraphs.

6.8 Managing the default values

pRack pR300 can manage two different sets of default values:

- user defaultsCarel defaults
- The two functions can be activated in main menu branch I.d.

A Important: after having reset the default values, the pRack pR300 board need to be switched off and on again.

6.8.1 Saving and resetting the user default values

pRack pR300 can save the exact configuration set by the user inside the instrument, allowing it to be recalled at any time.

All the set values are saved, therefore loading user defaults restores the exact same conditions that the pRack pR300 controller was in when the data were saved.

Note: only one user default configuration can be saved, therefore when the data is next saved, this overwrites the previous data.

Important:

- the Carel default reset procedure totally deletes the pRack pR300 permanent memory, and consequently is an irreversible operation;
- the user values cannot be reset after updating the software on the pRack pR300, nonetheless see Chapter 10 for details on how to save the parameters for versions different of the software.

6.8.2 Resetting the Carel default values

The Carel default values are shown in the Parameters table in Chapter 7.

The values pre-set by Carel can be installed at any time, restoring the pRack pR300 default settings, and requiring the startup procedure described in Chapter 4 to be repeated.

Important: the Carel default reset procedure totally deletes the pRack pR300 permanent memory, and consequently is an irreversible operation; nonetheless, the user settings can still be restored if these have already been saved. Given that pRack pR300, following the installation of the Carel default values requires the startup procedure to be repeated, select the first pre-configuration and then restore the user defaults.

Note: to complete a new configuration procedure as described in Chapter 4, first restore the Carel default values.

7. PARAMETERS TABLE

"Mask index": indicates the unique address of each screen and consequently the path needed to reach the parameters available on this screen; for example, to reach the parameters corresponding to the suction pressure probe with mask index Bab01, proceed as follows:

Main menù 💯 B. I n. ∕Out. →a. Status→b. Anal og. i n.

Below is the table of the parameters that can be displayed on the terminal. The values indicated with '---' are not Significant or are not set, while the values indicated with '...' may vary according to the configuration, with the possible options visible on the user terminal. A row of '...' means that there are a series of parameters Similar to the previous ones.

Note:Not all the screens and parameters shown in the table are always visible or can be set, the screens and parameters that are visible or can be set depend on the configuration and the access level.

Tab. 7.a

8. ALARMS

pRack pR300 can manage both alarms relating to the status of the digital inputs and to operation of the system. For each alarm, the following are controlled:

- The actions on the devices, if necessary
- The output relays (one global and two with different priorities, if configured)
- The red LED on the terminal and the buzzer, where present
- The type of acknowledgement (automatic, manual, semiautomatic)
- Any activation delay

The complete list of alarms, with the related information as described above, is available in Appendix A.4.

8.1 Alarm management

All alarms feature the following behaviour:

- When an alarm is activated, the red LED flashes and the buzzer is activated (where present); the output relays corresponding to the global alarm and to any alarms with priority are activated (if configured)
- Pressing the 🔆 (Alarm) button, the red LED stays on steady, the buzzer is muted and the alarm screen is shown
- If there is more than one active alarm, these can be scrolled using ↑ (Up) ↓ (Down). This condition is signalled by an arrow at the bottom right of the screen
- Pressing the \Re (Alarm) button again for at least 3 seconds acknowledges the alarms manually, and these are cleared from the display unless others are active (they are saved in the log)

8.1.1 Priority

For certain alarms, the alarm output relay can be set with two types of priority:

- R1: serious alarm
- R2: normal alarm

The corresponding relays, once configured, are activated when an alarm with the corresponding priority occurs.

For the other alarms, the priority is fixed and is associated by default with one of the two relays.

8.1.2 Acknowledgement

The alarms can have manual, automatic or semiautomatic acknowledgement:

- Manual: the alarm is acknowledged by pressing the \cancel{k} (Alarm) button twice, the first time displays the corresponding alarm screen and mutes the buzzer, the second (extended, for at least 3 seconds) cancels the alarm (which is saved in the log). If the alarm is still active, acknowledgement has no effect and the signal is shown again.
- Automatic: when the alarm condition ceases, the alarm is automatically reset, the LED comes on steady and the corresponding screen remains

displayed until the \cancel{R} (Alarm) button is pressed and held; the alarm is saved in the log.

 Semiautomatic: acknowledgement is automatic, until a maximum number of activations in set time. If the number reaches the maximum set, acknowledgement becomes manual.

For manual acknowledgement, the functions associated with the alarm are not reactivated until acknowledgement has been completed, while for automatic acknowledgement they're reactivated as soon as the alarm condition ceases.

8.1.3 Log

- The alarm log can be accessed:
- from branch G.a of the main menu
- by pressing the
 → (Alarm) button and then
 ← (Enter) when there are no active alarms
- by pressing ← (Enter) after having scrolled all the alarms.

The alarm log screens show:

- 1. Order of activation (no. 01 is the oldest alarm)
- 2. Hour and date the alarm was activated
- 3. Short description
- 4. Main values recorded at the moment the alarm was activated (suction pressure and condensing pressure)

Note: A maximum of 50 alarms can be logged; after this limit any new events overwrite the oldest ones, which are therefore deleted.

8.2 Compressor alarms

The number of alarms for each compressor can be set during the configuration phase using the Wizard or subsequently from branch C.a.e/ C.b.e of the main menu. The number of alarms is the same for all the compressors on the same line.

8.2.1 Allarmi dei compressori per linea

Alarms caeøi
NUMBER OF alarms
for each compressor:
З

Note: The maximum number of alarms that can be configured for each compressor depends not only on the type of compressor, but also on the size of pRack and the number of compressors fitted.

After having selected the number of alarms (maximum 4 for the reciprocating or scroll compressors and 7 for screw compressors), the settings can be configured for each alarm, choosing a description from the options shown in the table, the output relay, the type of reset, delay and priority. The effect of the alarm on the devices is set and involves stopping the compressor, except for the oil warning.

Possible descriptions for compressor alarms

Reciprocating or scroll	Screw	
Generic	Generic	
Overload	Overload	
High pressure	High pressure	
Low pressure	Low pressure	
Oil	Oil	
	Screw rotation	
	Oil warning (Filter Blocked)	
		Tah 8 a

An example of a screen for selecting the description of the alarm is shown in the figure:

Alarms	caeøz
AlarM 1 descrip	tion:
generic:	121
overload:	
High pressure:	
Low pressure:	
Oil:	

ENG

After having selected the 'generic' description, no other description can be selected. In general, the descriptions are divided into four groups: • generic

- others (overload, oil, high pressure, low pressure)
- screw rotation
- oil warning

After a description has been selected for a certain group, descriptions from a different group can not be selected for that alarm. For example, generic only, or overload + oil, or rotation only or overload + high pressure., etc. can be selected. Each alarm will have one alarm screen, which will show all the descriptions associated to that alarm. Based on the number of alarms selected, the descriptions associated by default are shown in the table below.

Default descriptions based on the number of alarms

Number of alarms	Descriptions	
1	Generic	
2	Overload	
2	HP-LP	
	Overload	
3	HP-LP	
	Oil	
	Overload	
4	HP	
4	LP	
	Oil	
	Overload	
	HP	
5	LP	
	Oil	
	Oil warning	
	Overload	
	HP	
C	LP	
6	Oil	
	Oil warning	
	Rotation	
	Overload	
	HP	
	LP	
7	Oil	
	Oil warning	
	Rotation	
	Generic	
		b. 8.b

Note: for oil alarms, special management is available whereby the alarm is interpreted as an oil level alarm. When the alarm is activated, a number of attempts are made to restore the level for a set time before the alarm is signalled and the compressor stopped; see paragraph 6.6.1 for details.

If a modulating device is used for the compressors, further alarms become available.

- compressor inverter warning, common for the entire suction line, when the device is an inverter
- oil sump temperature alarm, high discharge temperature and oil dilution, for Digital Scroll[™] compressors

For each compressor, two alarm variables are sent to the supervisor, one for each priority. As well as the alarm signal, the description of the alarm is also sent to the supervisor, using the values shown in the table:

The supervisor can interpret the variables sent by pRack pR300 and provide the correct description of the alarm.

8.2.2 Low superheat alarm

The parameters corresponding to these alarms can be set in branchC.a.e.C.b.e branch of the main menu. For this type of alarm, if enabled, you can choose whether to set a warning and an alarm or just an alarm. If enabled, it is possible to set the absolute (absolute) threshold and the activation

You can also set the delay after which the alarm is entered. When a warning and alarm is selected, if the measured overheating falls below the set threshold, the warning is signaled for the signaling purpose only, and after the delay has been set, the alarm is triggered.

If the special option is enabled, the low overheating alarm has the capability to turn off all compressors without the timing, so when all the compressors of the affected line are switched on immediately when the alarm is activated.

This alarm features manual or automatic reset, as configured by the user.

Pressure and prevent alarms 8.3

pRack pR300 can manage pressure alarms from a pressure switch or probe, according to the following diagram.

Alarms from pressure switch:

- Low suction pressure
- High condensing pressure

Alarms from probe:

- Low suction pressure
- · High suction pressure
- Low condensing pressure
- High condensing pressure
- One possible example for the low pressure alarms is shown in the figure:

In addition, the high pressure alarm features a prevent function, available by manually overriding the devices as well as using additional functions, such as heat recovery and ChillBooster.

Operation of the alarms and prevent function is described below.

Pressure alarms from pressure switch 8.3.1

The parameters corresponding to these alarms can be set in branch G.c.a/G.c.b of the main menu.

Low suction pressure from pressure switch

The low suction pressure alarm from pressure switch has the effect of stopping all the compressors without observing the various times, therefore when the digital input configured as low pressure switch is activated, all the compressors on the line affected are stopped immediately.

This alarm features semiautomatic reset, and both the monitoring time and the number of activations in the specified period can be set. If the number of activations is higher, reset becomes manual.

In addition, the delay after which the alarm is activated on both start-up and during operation can be set.

The delay at start-up only applies to unit start-up and not compressor power-up.

High condensing pressure from pressure switch

The high condensing pressure alarm from pressure switch has the effect of stopping all the compressors without observing the various times and forcing the fans on at maximum speed, therefore when the digital input configured as high pressure switch is activated, all the compressors on the line affected are stopped immediately and the fans operate at maximum output.

This alarm features manual or automatic reset, as configured by the user. The delay after which the alarm is activated can also be set

8.3.2 Pressure alarms from probe

The parameters corresponding to these alarms can be set in branch C.a.e/C.b.e of the main menu for the suction pressure and D.a.e/D.b.e for the condensing pressure.

For these types of alarms, reset is automatic and the activation threshold and differential can be set, as well as the type of threshold, which may be absolute or relative to the control set point. The figure shows an example of setting the threshold to relative.

Fig. 8.b

Note: for temperature control, the alarms from probe are managed based on temperature even when pressure probes are fitted.

The effects of the different pressure alarms from probe are described below.

Low suction pressure from probe

The low suction pressure alarm from probe has the effect of stopping all the compressors, ignoring the times.

High suction pressure from probe

The high suction pressure alarm from probe has the effect of forcing all the compressors on, ignoring the control times, but observing the compressor protection times.

Low condensing pressure from probe

The low condensing pressure alarm from probe has the effect of stopping all the fans, ignoring the times.

High condensing pressure from probe

The high condensing pressure alarm from probe has the effect of forcing all the fans on and stopping all the compressors, ignoring the times.

8.3.3 High pressure prevention

pRack pR300 can manage 3 types of high condensing pressure prevention actions, involving:

- · overriding the compressors and fans
- activating heat recovery
- activating ChillBooster

Prevent by overriding the compressors and fans

The parameters relating to this function can be set in branch G.b.a/G.b.b of the main menu.

The effect of this type of prevent action is to force all the fans on at maximum and switch all the compressors off, except for the minimum capacity stage, ignoring the control times but observing the compressor protection times. The minimum capacity stage means one compressor in the case of compressors without capacity control and modulation devices, or the minimum capacity stage for capacity-controlled compressors (e.g. 25%), or alternatively the minimum output of the modulation device in the case of inverters, Digital Scroll[™] compressors or screw compressors with continuous modulation.

As well as the activation threshold, which is always absolute, and the activation differential, a compressor deactivation time can be set, corresponding to the time needed to switch off all the compressors, except for the minimum capacity stage.

In addition, both the monitoring time and the number of activations in the specified period can be set. If the number of activations is higher, reset becomes manual.

Prevent by activating heat recovery

The parameters corresponding to this function can be set in branch G.b.a/G.b.b of the main menu, if the heat recovery function is present.

As well as enabling the function, an offset from the activation threshold for the prevent by overriding devices function must be set. The activation differential for this function is the same as set for the prevent by overriding devices function.

When reaching the threshold, pRack pR300 activates the heat recovery function, if the conditions allow; see paragraph 6.6.3 for details.

Prevent by activating ChillBooster

The parameters relating to this function can be set in branch G.b.a/G.b.b of the main menu, if the ChillBooster function is present.

As well as enabling the function, an offset from the activation threshold for the prevent by overriding devices function must be set. The activation differential for this function is the same as set for the prevent by overriding devices function.

When reaching the threshold, pRack pR300 force activates the ChillBooster, if the conditions allow; see paragraph 6.6.5 for details.

The following figure illustrates the activation thresholds for the prevent function and the safety devices:

8.3.4 Prevent low suction pressure

pR300 offers the possibility to reduce compressor capacity in the event of low suction pressure. The parameters relating to this function can be set in branch G.b.a/G.b.b of the main menu.

The effect of this function is to operate the compressors at a set percentage of capacity as soon as pressure falls below the prevent set point and related differential (screen Gab06)

In addition to the activation threshold, which is always absolute, and the activation differential, a compressor deactivation time can be set, corresponding to the time needed to switch off all the compressors except for the minimum capacity step.

The evaluation time and number of activations allowed in a certain time period can also be set. If the number of activations exceeds the setting, manual reset is required (screen Gab07)

When the prevent function is activated, an alarm icon is shown on the main screen, and a warning screen appears in the alarms.

Prevent low suction pressure with auxiliary control

Advanced configurations are available when using auxiliary control, so as to ensure a better response when activated.

If the suction pressure falls below the set threshold (screen Gba08), compressor capacity is reduced proportionally to the limit set point. Normally, when the prevent function ends, the current capacity is instantly brought to the level needed to meet the control request. If the parameter "Align request after prevent" is enabled (screen Gba09), the current request is aligned with the limit value.

9. SUPERVISORY AND COMMISSIONING SYSTEMS

pRack pR300 can be connected to various supervisory systems, specifically the Carel and Modbus communication protocols can be used. For the Carel protocol, the PlantVisor PRO and PlantWatch PRO models are available.

In addition, pRack pR300 can be connected to the pRack Manager commissioning software.

9.1 PlantVisor PRO and PlantWatch PRO supervisory systems

Connection to Carel PlantVisor PRO and PlantWatch PRO supervisor systems uses the RS485 card already fitted on some models of pRack pR300. For details on the models of card available, see Chapter 1.

Note: In general, the pRack boards that manage the suction lines must be fitted with the supervisor connection card, consequently boards with pLAN address 1 or 2. It is also possible to use the CAREL protocoll to both BMS ports (J25 biul-it and optional) of eacn board. If a port is used with CAREL protocoll, it is necessary to set the other with sarà MODBUS protocoll.

Three different models of PlantVisor PRO and PlantWatch PRO are available, used to supervise system configurations with one or two lines:

- L1 one line: can be used for system configurations with just one suction and/or condenser line.
- L2 one line: can be used for system configurations with two suction and/or condenser lines, and the two suction lines are managed by separate boards.
- Two lines: can be used for system configurations with two suction and/ or condenser lines, and the two suction lines are managed by the same board.

Important: model L2 – One line must be used only in association with model L1 – One line. For supervision of system configurations with just one line only model L1 – One line can be used.

Tutorial: the rule applied for using the models is summarised below:

- cconfiguration with board with pLAN address 2 ightarrow separate models
- configuration without board with pLAN address 2 ightarrow one model only

A connection example for using $\mathsf{PlantVisor}\ \mathsf{PRO}\ \mathsf{and}\ \mathsf{PlantWatch}\ \mathsf{PRO}\ \mathsf{is}$ shown in the figure.

Fig. 9.a

The complete list of supervisor variables, with the corresponding addresses and descriptions, can be supplied upon request.

9.2 Commissioning software

pRack Manager is configuration and real-time monitoring software used to check the operation of pRack pR300, for commissioning, debug and maintenance operations.

The software is available on the internet at http://ksa.CAREL.com in the section "download à support à software utilities".The installation includes, in addition to the program, the user manual and the necessary drivers.

pRack Manager can be used to set the configuration parameters, modify the values of volatile and permanent variables, save graphs of the main system values to file, manually manage the unit I/Os using simulation files and monitor/reset alarms on the unit where the device is installed.

pRack pR300 is able to virtualise all the inputs and outputs, both digital and analogue, therefore each input and output can be overridden by pRack Manager.

pRack Manager manages <file name>.DEV files that contain the user parameter configurations and that can be downloaded from the pRack pR300 board and then subsequently uploaded.

To use the pRack Manager program, a serial converter output RS485 with CVSTDUTLF0 (telephone connector) or CVSTDUMOR0 (3 pin terminal) must be connected to the board.

The connection to pRack Manager can be made:

- 1. Via the RS485 serial port used for the "pLAN" connection
- 2. Via the BMS serial port with RS485 serial card and activating the pRack Manager protocol by parameter on screen Fca01 or connecting pRack Manager and selecting SearchDevice = Auto (BMS or FB) on the "Connection settings" tab. In this case, the connection is established after around 15-20 seconds.

Important: the BMS serial port should only be used for monitoring the variables, while to update the software use the RS485 serial port dedicated to the pLAN connection.

The following figure shows an example of connection to the PC via the RS485 serial port used for the "pLAN" connection

Note: for further details see the pRack Manager program online help.

10. UPDATING THE SOFTWARE

The pRack pR300 boards are supplied with the software already loaded. If an update is required, the following can be used:

- pRack Manager
- SmartKey programming key

Note: The pRack pR300 software is protected by digital signature and cannot be loaded onto hardware other than pRack pR300 (e.g. pCO3), otherwise after 5 minutes of operation the software locks up, all the relays open and the warning "INVALID OEM IDENTIFIER" is shown.

The update files are available at http://ksa.CAREL.com.

Important: each version of the pRack pR300 software is associated with a specific controller firmware version (BIOS), therefore if updating the version, always check and where necessary update the BIOS on the board. The appropriate BIOS version is supplied together with the pRack pR300 update files.

10.1 Updating using pRack Manager

The software resident in the pRack pR300 boards can be updated from a PC.

For the connection procedure see Chapter 9, while for further details see the pRack Manager program online help..

Note: The pCOLoad program can also be used to update the pRack pR300 software, however Winload cannot be used.

10.2 Updating using SmartKey

The SMARTKEY programming key can copy the contents of one pRack pR300 board to another identical board, using the telephone connector on the terminal (the pLAN must be disconnected).

From a PC, with the SmartKey Programmer software running, the key can be configured to perform specific operations: acquire log files, program applications, etc.

The SmartKey Programmer software is installed together with pRack Manager.

The following figure shows the connection of the SmartKey to the PC using the PCOSO0AKY0 converter.

Note: for further details on using the SmartKey, see the corresponding instruction sheet. For details on the SmartKey Programmer see the online manual.

10.3 Pendrive: operating instructions

10.3.1 File extensions, names and contents

Various types of files can be uploaded and downloaded and are distinguished by their extension.

File names

Where

In order to be recognised, the names of the directories and files on the pendrive must have no more than 8 characters; the controller makes no distinction between upper-case and lower-case characters. However, during DOWNLOAD the names of the directories created by the controller on the pendrive are always in upper-case.

FILE TYPES FOR UPLOAD

File extension	Description
.IUP	Contains the definitions of the screens on the terminal
.BLB	Contains the application
.BIN	Contains the application (with pLAN table)
.BLX	Contains the Logique of atoms custom in C language
.GRP	Contains the graphics
.DEV	Contains the preset configuration parameter values
PVT,.LCT	Contains the descriptions of the public variables to be logged.
	Generated by 1Tool, this is used by the LogEditor module and
	must be loaded together with the LCT file

Downloaded files are saved in directories created automatically, with the following name format:

NAMXY_WZ

NAM: identifies the type of data downloaded (LOG for logs, BKP for the application, DEV for the buffer memory, CPY for all the data from the controller).

XY: progressive number from 0 to 99 WZ: controller pLAN address.

Example: a directory named LOG00_01 contains the log files (LOG) downloaded from a device whose pLAN address is 1. Since the key contained no directory of this type before download, it is indicated with 00.

Important: No more than 100 files of the same type can be downloaded to the pendrive, as the directories created can only be numbered with XY=00 to 99.

FILE TYPES FOR DOWNLOAD (controller pLAN address = 1)

File extension	Directory name	Description	
.DWL	LOG00_01	Logged data	
.DWL,.DEV,.LCT,.PVT	BKP00_01	Application	
.DEV	DEV00_01	Non-volatile parameters	
.DWL,.DEV,.LCT,.PVT	CPY00_01	All data on the controller	
			Tab. 10.c

The downloaded files to have fixed names. In particular, the application file is called "ppl–pRack.dwl", the BIOS file "bios–pRack.bin", the files containing the logs and related information are "logs.dwl", "logs.lot" and "logs.pvt", respectively. Finally, the buffer memory is saved to the file on the pendrive.

Menu access

The following are the steps for accessing the pendrive management menu. Procedure:

1. Connect the pendrive to the master port.

2. Press Alarmand Entertogetherfor 3 seconds to enter the option menu. Select FLASH/USB memory and press Enter to confirm.

3. Select USB pen drive and press Enter to confirm.

Important: Wait a few seconds after the pendrive has been plugged in for it to be recognised by the controller. If the message "No USB disk or PC connected" is displayed momentarily with the request to connect a pendrive key or computer USB cable, wait a few seconds until the recognition message is shown ("USB disk found") and the following screen appears.

4. Select UPLOAD.

10.3.2 Upload

An application plus BIOS or buffer memory (parameters) can be uploaded from the pendrive. The following modes are available: automatic, autorun and manual. Automatic and autorun modes require using configuration files.

Configuration file structure

Configuration files must start with the string "[FUNCTION]" followed by a string that identifies the function, as shown in the table.

Function	String
UPLOAD an application or a BIOS file plus an	Upload application
application	
UPLOAD non-volatile memory (.dev)	Upload non volatile memory
UPLOAD the entire contents of the pRack	Copy pRack upload

After the description of the desired function, various options are available:To copy the complete contents of the directory, simply write the name of the directory (e.g. the entire contents of the CHILLER directory):

[FUNCTION] Upload non volatile memory
[DIR] CHILLER

2. To copy just 1 file in a directory, enter the file's name (e.g. the CHILLER.DEV file in the CHILLER directory).

[FUNCTION]	
Upload non volatile memory	
[DIR]	
CHILLER	
CHILLER.DEV	

To show a string on the display describing the operation being performed, add the "[NAM]" instruction, followed by the string to display. The following file will display the string:

"UPL CHILLER.DEV"
[FUNCTION]
Upload non volatile memory
[DIR]
CHILLER
[NAM]
UPL CHILLER.DEV
CHILLER.DEV

3. To select only some of the files in the same directory, list them after a label. The following labels are allowed and **must be entered in the order shown in the table**:

UPLOAD file labels

No.	Label	File type	No.	Label	File type
1	[BIO] (*)	file.bin	6	[PVT]	file.pvt
2	[IUP]	file.iup	7	[LCT]	file.lct
3	[BIN]	file.bin, blb	8	[OED]	file.oed
4	[DEV]	file.dev	9	[SGN]	file.sgn
5	[GRP]	file.grp			

(*) BIO = BIOS file

- to get the.bin file from the BIOS in the format available on http://ksa. carel.com (.os file), unzip the.os file;
- the [IUP] label can be followed by one or more ".iup" files.

- the order in which the file names are entered is fundamental and must not be changed;
- do not enter empty lines or spaces in the file (e.g. at the end of a line);
- each file after the last line of code must contain a "carriage return" character (CR,J), as shown in the following example.

<u>CAREL</u>

Example: The following file will upload the BIOS and an application.

[FUNCTION],_J
Upload application₊J
<u>ــ</u>

[LCT] ,
AHU.lct 🚽

10.3.3 Automatic upload

To automatically upload the parameter memory using the first configuration file shown in the preceding paragraph, access the system menu as previously described and proceed as follows:

1. Select automatic mode. A screen is shown describing the function of the buttons. Press Enter to confirm.

2. Confirm by selecting Prg. A screen is displayed requesting confirmation to upload the non-volatile memory. Press Enter to confirm.

3. At the end a message will ask the user to remove the pendrive.

10.3.4 Upload in autorun mode

Uploading in autorun mode is a special case of uploading in automatic mode. Unlike automatic mode, the user must wait for a specific message to appear on the display to start or disable the operation described in the configuration file. To upload a file in autorun mode, a configuration file must be created and named "autorun.txt".

Example of uploading BIOS+application

The upload involves two steps: first the BIOS is updated and then the application. The information is shown on the pRack's built-in display and on the pGDE terminal, when both are featured.

Procedure:

1. Connect the pendrive to port A.

2. After a few seconds, Autorun mode starts. Press Enter to confirm.

3. The validity of the FW is checked and the BIOS is loaded.

4. The display flashes to indicate that after loading the new BIOS the controller is being reset.

Fig. 10.I

5. The test phase starts.

Fig. 10.o

6. The controller warns that no application has been loaded.

7. The application update then starts.

 Remove the pendrive. The update is complete. Wait for the display to stop flashing, indicating that the controller is being reset before restarting.

Important: As can be seen, when updating the BIOS and the application, the pGDE terminal shows the message "NO LINK", meaning that no connection is established. Do not remove the terminal and wait for the end of the update procedure, when the pGDE terminal replicates the messages on the built-in display.

Note: Autorun run is especially useful in those cases in which the same operation needs to be performed on several controllers. For example, to load different applications on controllers connected in a pLAN network, only one autorun file needs to be created; this uploads the various directories contained on the pendrive based on the address of the controllers. The controller with address XY will only load the directory called "nomedir_XY" ["DirName_XY"]. The pendrive then only needs to be plugged into each controller to run the upload, confirming from the shared terminal.

10.3.5 Manual upload

To manually upload the contents of the pendrive the user must access the management menu from the system screens, selecting UPLOAD and then MANUAL. The files are selected by pressing ENTER when the cursor is on the desired file name. A selected file is marked by the symbol "*" on the left. Once the files have been selected (all in the same directory), press PRG to start the upload. To display the contents of a directory press ENTER. To go up one directory level press ESC. Once the upload has started, the messages shown on the screen are the same as in automatic and autorun mode.

10.3.6 Download

As mentioned above, the DOWNLOAD operation can be managed in two ways:

- 1. Manual mode: follow the steps described in the paragraph "Automatic upload" and select manual operation. Then each file must be selected and downloaded.
- Autorun mode: prepare a file called "autorun.txt", containing a string that identifies the function to be performed.

Function	String
DOWNLOAD the application	Download application
DOWNLOAD non-volatile memory	Download non volatile memory (.dev)
DOWNLOAD the entire contents of	Copy pRack download
the pRack	

The result is the creation of files with the required extensions, which will be placed in the respective directories as described in the paragraph "File names". When the operation is completed, the display shows a message with the name of the directory created.

[FUNCTION]
Download application

The following screen will be displayed.

1. Press Enter to confirm.

2. Download completed.

Fig. 10.w

Example: On the controller with address 1, the autorun file will create a directory called BKP00_01 and copy the files APPL_PRack.DWL and FILE_DEV.DEV to this directory.

Connecting to a computer

Connect the slave USB port on the controller to the USB port on the computer where pRack Manager is installed.

Important:

- do not install any type of converter between the computer and port B, even if requested by the program's guided procedure;
- pRack Manager manages compressed files (.GRT/.OS).

Once the connection is established, the following operations are available:

- 1. UPLOADING the application or BIOS+application.
- 2. DOWNLOADING the non-volatile memory.
- 3. Commissioning
- 4. Managing the NAND flash memory.

Once the USB cable is removed, the port will become available again after approximately 5 s.

Important: If no connection is established with pRack Manager after plugging in the USB cable, wait at least 1 minute before using the USB ports again after removing the cable.

10.4 Configuring pCOWeb/pCOnet from a system screen

See par. 6.6 for information on how to access the BIOS system menu. Starting from:

- BIOS release 5.16 BIOS, and from
- pCOWeb firmware version A1.5.0, and from
- pCOnet firmware version A485_A1.2.1

pCOWeb and pCOnet communication parameters can be configured. The purpose is to configure the network (Ethernet for pCOWeb, RS485 for pCOnet) when the respective card is installed for the first time. The remaining parameters (alarms, events, etc.) can be configured using the usual tools, i.e. BACset or web interface (pCOWeb only). Configuration can be done either when using the Modbus protocol or the CAREL protocol, but only on the BMS1 serial port. The screens for configuring pCOWeb and pCOnet can be opened by accessing the system screens and selecting OTHER INFORMATION and then PCOWEB/NET Konfig. Then, select "PCOWEB settings" to configure pCOWeb parameters or "PCONET settings" to configure pCOnet parameters.

Configuring pCOWeb

When you select "PCOWEB settings" the following screen will appear:

D	Н	С	Ρ	:		-	-	-									
Ι	Ρ		А	D	D	R	Е	S	S								
			-	-	-		-	-	-	-	-	-	-	-	-		

After a short time the fields are populated with the current parameters. If the fields are not populated with the current parameters, check the firmware version of pCOWeb and the protocol used by the BMS serial port. The parameters can now be edited by selecting the respective fields using the ENTER button and setting the desired values using the UP/DOWN buttons. If the DHCP option is set to ON, the IP address and Netmask fields cannot be changed. Pressing ENTER repeatedly will display all the parameters available, as listed in the following screens:

											_			_	_			
N	е	t	m	а	s	k	:											
		-	-	-		-	-	-		-	-	-		-	-	-		
G	а	t	е	w	а	У	:											
		-	-	-		-	-	-		-	-	-		-	-	-		
D	Ν	S	1	:														
		-	-	-		-	-	-		-	-	-		-	-	-		
D	Ν	S	1	:														
		-	-	-		-	-	-		-	-	-		-	-	-		
В	А	С	n	е	t		Ι	D	:									
								-	-	-	-	-	-	-				
В	А	С	n	е	t		Т	У	р	е	:							

Once the parameters have been chosen they can be updated by going to the following screen and pressing ENTER.

Ρ	С	0	W	Е	В	С	0	Ν	F	I	G		Е	Ν	А	В	L	E	
U	р	d	а	t	е	р	С	0	W	е	b	?		Ν	0				

While the parameters are being updated, the following message is displayed:

	,																		
Ρ	С	0	W	Е	В	С	0	Ν	F	Ι	G		Е	Ν	А	В	L	Е	
Ρ	Ι	е	а	S	е	w	а	i	t		f	0	r						
е	n	d		0	f	u	р	d	а	t	е								

At the end, the screen shows:

Ρ	С	0	W	Е	В		С	0	Ν	F	Ι	G		Е	Ν	А	В	L	Е	
U	р	d	а	t	е		С	0	m	р	Ι	е	t	е						
R	е	b	0	0	t		р	С	0	W	е	b		t	0					
а	р	р	Ι	у		n	е	w		s	е	t	t	i	n	g				

Configuring pCOnet

When you select "PCONET settings" the following screen will appear:

В	А	С	n	е	t		Ι	D	:								
								-	-	-	-	-	-	-			
В	Α	С	n	е	t		b	а	u	d	:						
						-	-	-	-	-	-	-	-				

After a short time the fields are populated with the current parameters. The parameters can now be edited by selecting the respective fields using the ENTER button and setting the desired values using the UP/ DOWN buttons. Pressing ENTER repeatedly will display all the parameters available, as listed in the following screen:

В	А	С	n	е	t		М	А	С	:		-	-	-				
Μ	а	х		Μ	а	s	t	е	r	s	:		-	-	-			
Μ	а	х		F	r	а	m	е	s	:		-	-	-	-	-		

Once the parameters have been chosen they can be updated following the procedure described for configuring pCOWeb.

10.5 Saving parameters between different software versions

The configuration parameters can be saved and loaded after having updated the software. The update requires the files relating to the new version being loaded (files with the following extensions: .iup, .blx, .blb, .grt, .dev) and the connection files (files with the following extensions: .2ct, .2cd) for the installed version and the new version.

The connection files must be copied to the "2cf" directory under pRack Manager, for example C:\Program Files\CAREL\pRackManager\2cf.

The update procedure including saving the parameters is as follows (for details on the functions of the pRack Manager software see the online manual):

- 1. Switch the unit off from the user terminal or supervisor or digital input
- 2. Connect the PC where pRack Manager is installed using the pLAN serial (disconnect the terminal if necessary) and disconnect any BMS connections
- 3. Start the pRack Manager software
- In the "Connection settings" panel, set Baud rate to "Auto" and SearchDevice to "Auto (pLAN)" and select the COM port under PortNumber (if necessary, use the Wizard to detect the correct COM)
- 5. In Commissioning/Settings select the .2cf file relating to the version on pRack pR300, e.g. 1.0
- 6. Power down pRack pR300, power up again and wait for the controller to come "On line"
- 7. In Device Configuration read all the variables and save them to an .txt file (required)
- 8. Update the software version on pRack pR300, selecting from pRack Load the following update files and selecting "Update graphic resources and "Enable zipped upload":
 - .iup (maximum 2 files)
 - .blx
 - .blb
 - ClearAllx.dev, where x is the pLAN address of the board being updated
- 9. Wait for the update procedure to end.
- $10. \ Powerdown, disconnect the {\sf PC} and if necessary reconnect the terminal$
- 11. Power up again and run a quick start-up procedure (pre-configurations or Wizard, confirming the default parameters)
- 12. Power down

- 13. Reconnect pRack Manager and power up again
- 14. InCommissioning/Settingsselectthe.2cffilerelatingtothenewversion now loaded on pRack
- 15. From Device Configuration, import the previously saved .txt file and write all the variables
- 16. Power down, disconnect the PC and reconnect the terminal if necessary
- 17. Power up again

At the end of the procedure, pRack pR300 will be programmed with the updated software and the previously configured parameters.

Important: if using the BMS serial port to read/write variables, pRack pR300 continues operating, and therefore software malfunctions may occur. Consequently, use the RS485 serial port provided for the pLAN connection when carrying out the software update operations described above.

Note: to update the software without maintaining the parameter configuration, simply complete steps 1 to 4 and 8 to 10 in the previous procedure. In this case, the unit will need to be reconfigured using the complete start-up procedure.

11. APPENDIX

A.1 System configurations available

The system configurations available are shown in the table:

System configurations:

Configuration number	Description	Suction lines	Condenser lines	Compressors L1/L2	Maximum number of compressors per line L1/L2	Units present in pLAN (in addition to the terminal)	Reference diagram
1	No suction line, one condenser line	0	1	-	-	1	а
2	No suction line, two condenser lines	0	2	-	-	1	а
3	1 suction line (scroll or piston compressors), no condenser line	1	0	scroll, piston	12	1	а
4	1 suction line (scroll or piston compressors), 1 condenser line	1	1	scroll, piston	12	1	а
5	1 suction line (scroll or piston compressors), 1 condenser line on a separate board	1	1	scroll, piston	12	1, 3	b
6	2 suction lines on the same board (scroll or piston compres- sors), no condenser line	2	0	scroll, piston/ scroll, piston	12/12	1	С
7	2 suction lines on the same board (scroll or piston compres- sors), 1 condenser line	2	1	scroll, piston/ scroll, piston	12/12	1	С
8	2 suction lines on the same board (scroll or piston compres- sors), 1 condenser line on a separate board	2	1	scroll, piston/ scroll, piston	12/12	1, 3	е
9	2 suction lines (scroll or piston compressors), 2 condenser lines on the same board	2	2	scroll, piston/ scroll, piston	12/12	1	f
10	2 suction lines on the same board (scroll or piston compres- sors), 2 condenser lines on separate boards	2	2	scroll, piston/ scroll, piston	12/12	1, 3	g
11	2 suction lines on separate boards (scroll or piston compres- sors), 1 condenser line on suction line 1 board	2	1	scroll, piston/ scroll, piston	12/12	1, 2	h
12	2 suction lines on separate boards (scroll or piston compres- sors), 1 condenser line on a separate board	2	1	scroll, piston/ scroll, piston	12/12	1, 2 ,3	d
13	2 suction lines on separate boards (scroll or piston compres- sors), 2 condenser lines (one for each suction line board)	2	2	scroll, piston/ scroll, piston/	12/12	1, 2	h
14	2 suction lines on separate boards (scroll or piston compres- sors), 2 condenser lines on separate boards	2	2	scroll, piston/ scroll, piston/	12/12	1, 2, 3, 4	i
15	1 suction line (up to 2 screw compressors), no condenser line	1	0	screw	2	1	а
16	1 suction line (up to 2 screw compressors), 1 condenser line	1	1	screw	2	1	a
17	1 suction line (up to 2 screw compressors), 1 condenser line on a separate board	1	1	screw	2	1, 3	b
18	2 suction lines on separate boards (up to 2 screw compres- sors on line 1 and scroll or piston compressors on line 2), 1 condenser line on suction line 1 board	2	1	screw/scroll, piston	2/12	1, 2	h
19	2 suction lines on separate boards (up to 2 screw compres- sors on line 1 and scroll or piston compressors on line 2), 1 condenser line on a separate board	2	1	screw/scroll, piston	2/12	1, 2, 3	d
20	2 suction lines on separate boards (up to 2 screw compres- sors on line 1 and scroll or piston compressors on line 2), 2 condenser lines (one for each suction line board)	2	2	screw/scroll, piston	2/12	1, 2	h
21	2 suction lines on separate boards (up to 2 screw compres- sors on line 1 and scroll or piston compressors on line 2), 2 condenser lines on separate boards	2	2	screw/scroll, piston	2/12	1, 2, 3, 4	i
22	2 suction lines on separate boards (scroll or piston compres- sors), 2 condenser lines (line 1 on separate board, line 2 on board in common with suction)	2	2	scroll, piston/ scroll, piston	2/12	1, 2, 3, 4	

Tab. A.a

The system configurations available refer to the following diagrams:

a. up to 1 suction line (scroll or piston compressors) and up to 1 condenser line on just one pRack pR300 board:

b. 1 suction line (scroll or piston compressors) and 1 condenser line on a separate board:

c. 2 suction lines on the same board (scroll or piston compressors) and up to 1 condenser line:

d. 2 suction lines on separate boards (up to 2 screw compressors on line 1 and scroll or piston compressors on line 2), 1 condenser line on a separate board:

e. 2 suction lines on the same board (scroll or piston compressors), 1 condenser line on a separate board:

A.2 Special configurations for subcritical CO, systems, cascade and pumped systems

A.2.1 Cascade

The crucial aspect of this type of system is the cascade heat exchanger, normally a plate heat exchanger, which controls the condensing stage of the CO₂ system. At times there are two heat exchangers, so as to improve control at low loads and increase safety, and these are normally controlled by EXV electronic expansion valves with stepper motors. In these applications, as well as traditional control based on suction superheat, there is also integration with the low temperature rack, directly when the rack controller has a built-in driver, or via serial communication for external EVD EVO drivers. Given the nature of the refrigerant, condensed liquid CO₂ needs to be monitored in order to ensure good performance and protection. Up to 2 heat exchangers can be connected via Fieldbus to the pRack controller, with a driver for each heat exchanger. The drivers are connected to the board that manages the low temperature suction line. Up to 6 control steps can be configured for connecting other drivers controlled via digital input for superheat control. There can be maximum two plate heat exchangers used to condense CO₂, and the expansion valve is managed using the built-in driver on pRack pR300 or external EVD EVO driver suitably integrated into the system (Fieldbus communication over RS485).

Legenda:

	Description	Duchation	Netes
ac.	Description	Probe type	Notes
Text	Outside temperature	NTC - HP	
PD	Discharge pressure line 1	4-20 mA 0-18.2 barg	
	(medium temperature)		
TD _{L1}	Discharge temperature line 1	NTC - HF	To control discharge
	(medium temperature)		temperature (opt.)
PS _{L1}	Suction pressure line 1	4-20 mA 0-7 barg	Can be used as backup
	(medium temperature)		for PE
TSL1	Suction temperature line 1	NTC - HF	To control suction
	(medium temperature)		superheat (opt.)
P _F	Heat exchanger evaporation	Ratiometric -1-9.3	
-	pressure	barg	
T _{GS}	Heat exchanger superheated	NTC – HF	
	gas temperature		
PD _{L2}	Discharge pressure line 2	4-20 mA 0-44.8 barg	
	(low temperature)		
TD _{L2}	Discharge temperature line 2	NTC – HF	To control discharge
	(low temperature)		temperature (opt.)
PS ₁₂	Suction pressure line 2 (low	4-20 mA 0-44.8 barg	
	temperature)		
TS _{L2}	Suction temperature line 2	NTC - HF	To control suction
	(low temperature)		superheat (opt.)
			Tab. 11.b

The exchange of information between compressor rack and heat exchanger allows traditional superheat control to be augmented by factors that are vital for this type of system, such as variation in low temperature compressor rack cooling capacity and the trend in CO₂ condensing pressure. (pRack only sends the control parameters and the cooling capacity to vary). The drivers connected via serial have advantages over external configurations (via digital inputs) as the parameters are easier to set (the driver screens can be accessed directly from the pRack controller) and are more responsive when unit cooling capacity changes considerably due to due peaks in demand. The drivers connected via serial can use an estimated percentage of cooling capacity delivered by the circuit to influence normal superheat control.

When the variation in capacity exceeds 10% or when control commences, the driver pre-positions the valve to get closer to the optimum opening. This operation ensures good control of condensing pressure on the low temperature rack (S3 or A, configurable) when compressor on line 2 start. If the compressors on the low temperature rack are controlled by inverter, capacity modulation will be much more linear and anticipation of valve movements will have less influence (in terms of pre-positioning). If using one or more single drivers, the condensing pressure probe can be connected directly to the EVD EVO driver (S3), allowing just one pressure probe to be used for condenser control and for the EVD EVO driver safety procedure, which tends to open the valve when the CO₂ condensing temperature is too high. In this case, the CO₂ condensing pressure probe connected to pRack is optional.

This function can be used with the following configurations:

- pRack pR300 with built-in driver and just one heat exchanger
- pRack pR300 with single external EVD EVO driver
- pRack pR300 with 2 single external EVD EVO drivers
- pRack pR300 with 2 EVD EVO drivers, one of which built-in (only 1 exchanger) and 1 single external.

Note: if serial communication between driver and pRack is interrupted, the condensing pressure probe on the pRack, connected to the driver, will be disconnected and the safety procedures featured on pRack will be activated (alarm signal, use of the backup probe if configured, fan operation overridden to a preset value). One DRIVER is needed for each valve; if a Twin Driver is used, this will be managed as a single driver. The connection should be done on the first valve too (EXV1- J27 if a built-in driver is used).

Details of the pRack configuration Wizard

1	Ŵ	i	z	a	r	d			_			_	_	_	_	_		1	ь	9	1
т	y	P	e		0	f		i	n	ų	t	a	1	1	9	t	i	0	n	1	
			S	υ	С	Ť	1	0	H		8		С	0	Н	D	E	Ν	S	E	R
P	1	a	n	t											С	A	S	С	A	D	E

After having selected this type of configuration, the software takes a few seconds to pre-configure some settings relating to a typical cascade system, i.e. the second condenser line; the Wizard will prompt whether to

<u>CAREL</u>

control the CO₂ condenser using the fans or the new EVS system:

Note: carefully check the pressure control settings; for general uniformity of the software, automatic set point selection is not featured for the different types of control and different types of refrigerant. For example, the suggested default set point for the low temperature compressors is 3.5 bars; in a cascade system (subcritical CO₂) with R744 natural refrigerant, the reference pressure values are around 11 bars. Together with the set point, the probe limits and probe alarm thresholds will be correctly configured.

• Cascade, 2 suction lines, 2 condenser lines (external driver for managing the heat exchanger on the second line), single board;

 Cascade, 2 suction lines, 2 condenser lines (built-in driver for managing the heat exchanger on the second line), single board;

Fig. A.n

• Cascade, 2 suction lines, 2 condenser lines (built-in driver for managing the heat exchanger on the second line), double board;

• Cascade, 2 suction lines, 2 condenser lines (built-in driver for managing the heat exchanger on the second line), double board;

A2.2 Pumped

Less used than traditional cascade subcritical systems, this solution limits the use of HFC refrigerants to the equipment rooms. The medium temperature units are supplied with pumped liquid CO_2 , while the low temperature units are fitted with expansion valves. The CO_2 is cooled by a dedicated chiller (NH3 or r134a) inside a tank, normally with a tube bundle evaporator. In addition to traditional systems, these also include management of the pumps that deliver the liquid CO_2 to the medium temperature evaporators, where it does not expand but rather is only superheated and returns to the receiver in a semi-liquid state.

In this type of system, it is important to coordinate operation of the medium temperature rack with tube bundle evaporator control, to prevent low pressure problems. Pressure control inside the receiver is the main task; given the quantity of refrigerant contained and consequently its significant inertia, it is essential to activate the compressors based on the receiver pressure, and medium temperature rack suction pressure will only be monitored for safety, to prevent low pressure problems.

Medium temperature circuit control

Medium temperature circuit control uses a pressure sensor installed on the low temperature receiver; in order to exploit this sensor, pRack needs to use an auxiliary control function available under COMPRESSORS— λ LINE 1— λ CONTROL, in screen Cab20

Comp.RegulL1	Cab20
Enable Aux re9.:	NO
Probe reg.type: PRESSU	JRE
Refri9.type:	R404A
Fig. 11.t	

This screen is used to enable the function, set the required type of control and the refrigerant in the auxiliary circuit.

An "auxiliary" control probe needs to be configured under INPUTS/ OUTPUTS→STATUS→ANALOG INPUTS in a free position on the controller. The high and low auxiliary pressure/temperature probe alarms need to be set under COMPRESSORS→LINE 1→ALARMS, checking the control parameters.

EVD EVO and EXV drivers

Management of the tube bundle evaporator is critical in these types of applications, and the size of the evaporator, inertia of the load and proximity to the compressors require very fine control, which needs to adapt rapidly when the compressors are started or stopped, respond gradually to changes of load, not flood the compressors, and protect against low suction pressure alarms.

Functions on the EVD EVO driver, such as low superheat, low suction temperature, low suction pressure and high CO_2 condensing pressure protection, therefore need to be correctly calibrated based on system features (number and type of compressors, size of the evaporator and the receiver, whether there are receivers on the suction line, system dynamics). All these settings are found under OTHER FUNCTIONS—SEVS on the board that manages suction line 1.

Note: One DRIVER is needed for each valve; if a Twin Driver is used, this will be managed as a single driver. The connection should be done on the first valve too (EXV1- J27 if a built-in driver is used).

• Pumped, 2 suction lines (external driver for managing the heat exchanger on the first line), 1 condenser line, single board;

<u>CAREL</u>

 Pumped, 2 suction lines (built-in driver for managing the heat exchanger on the first line), 1 condenser line, single board;

 Pumped, 2 suction lines (external driver for managing the heat exchanger on the first line), 1 condenser line, double board

Fig. A.u

• Pumped, 2 suction lines (built-in driver for managing the heat exchanger on the first line), 1 condenser line, double board

0

Note: don't configure the second condensing line.

A.3 System configurations with more than one pLAN board

If the system configuration involves the connection of more than one board in a pLAN, the addresses must be set correct before select a solution of configuration.

For the addresses to be assigned to the pRack pR300 boards see Appendix A.1.

pRack pR300 can use two user terminals (as well as a built-in terminal) with addresses 31 and 32. The default user terminal address is 32, so only if a second terminal is required must the address of this be set to 31, as described below. The address of the terminal is also required when having to set the address of the pRack pR300 boards, when multiple boards are connected to the pLAN.

After having correctly connected and configured the pLAN network of pRack pR300 boards, the system can be configured as described in paragraph 4.1.

A.3.1 Setting the address of the terminal

The pRack pR300 user terminal is supplied with the default address 32, allowing the terminal to be used without requiring any additional operations; nonetheless, in order to use an additional terminal or configure the pLAN address of the boards, it needs to be changed according to the following procedure:

- 1. power the terminal via the special telephone connector;
- 2. press the 3 buttons, ↑, ↓ and ← together for at least 5 seconds; the terminal will display a screen similar to the one below, with the cursor flashing in the top left corner:

- press ← once: the cursor will move to the "Display address setting" field;
- select the desired value using ↑ and ↓, and confirm by pressing ← again; if the value selected is different from the value saved, the following screen will be displayed and the new value will be saved to the display's permanent memory.

DiSPlay Changed	address

Important

- if the settings are not made correctly, the text and the images on the display will be displayed incorrectly and out of order.
- if during this operation the terminal detects inactivity of the pRack board whose output is being displayed, the display is cleared and a message similar to the one below is shown.

If the terminal detects inactivity of the entire pLAN network, that is, it does not receive any messages from the network for 10 seconds consecutively, it clears the display and shows the following message:

A.3.2 Setting the address of the pRack pR300 board

The pLAN address of the pRack boards can be set from any pGD1 terminal, using the following procedure:

- 1. set address 0 on the terminal (see the previous paragraph for details on how to set this address);
- 2. power down the pRack pR300 board;
- disconnect any pLAN connections to other boards from the pRack pR300 board;
- 4. connect the terminal to the pRack pR300 board;
- 5. power up the pRack pR300 board, while pressing the ↑ and ↓ buttons on the terminal together. After a few seconds the pRack pR300 board begins the start-up sequence and the display shows a screen similar to the one below:

- when this screen is displayed, wait 10 seconds and then release the buttons;
- 7. the pRack pR300 board interrupts the start-up sequence and shows a configuration screen, similar to the one below:

Then set the pLAN address using the ↑ and ↓ buttons on the terminal.
8. Confirm the address by pressing ←: the pRack pR300 board completes the start-up sequence and uses the set address.

A3.3 Example of configuring a system with 2 suction and condenser lines using the Wizard

Below is a possible example of using the Wizard to configure a typical system like the one shown in the figure, with 2 suction lines and 2 condenser lines on different boards:

Fig. A.w

The preliminary operations to be completed before configuration are as follows:

- with the boards not connected in the pLAN, power up the second pRack board and set the pLAN address to 2 (for details see Appendix A.2)
- 2. power down and connect the two boards in the pLAN, plus any terminals, as described in paragraph 3.7
- power up the boards and wait for the Wizard selection screen to be displayed

Then select the type of system as SUCTION & CONDENSER:

Wi zard		l b01
Type of I	ns	tallation:
SUCTI ON	&	CONDENSER

Set the type of compressors and control for suction line 1, answering the questions prompted by the pRack pR300 software, e.g.:

Wi zard	I b03
Compressor	config.
Compressor RECI	type: PROCATING
Compressor	number: 3

Wizard	I b40
Compressor con	fig.
Regulation by:	Ū
Ĕ PR	ESSURE
Measure unit:	barg
	U
Refrigerant:	R404A
-	

Wi zard	1b41
Compressor confi	g.
Compressor confi Regulation type: PROPORTIONAL	BAND
Enable integral action:	time YES

After having configured suction line 1, a prompt will be shown to configure another suction line, obviously the answer is YES:

Wi zard	Ib43
Compressor con	fig.
Configure anot suction line:	her YES

To the next question, which prompts if there is a pRack board dedicated to the second line, answer YES; in this way, the pRack pR300 software prepares to configure the board with address 2 in the pLAN:

Wizard	Ib45
Compressor confi	g.
Dedicated pRack board for suction line:	YFS

After having answered the questions for the configuration of the second suction line, the software then asks if there is a pLAN board dedicated to condenser line 1. In the case shown in the example, answer NO.

Wizard Ib9	0
Compressor config.	
Dedicated pRack board for condensing line: NO)

After having configured condenser line 1, the software asks if condenser line 2 is used; answer YES:

Wi zard	1b96
Configure anot condensing lin	her e: YES

After having configured the second condenser line, the software offers the option to automatically configure the I/Os (choosing YES), as described in par. 4.1.4. If choosing NO, each individual I/O needs to be configured manually at the end of the wizard. In addition, the software asks the user whether or not to display a summary of the settings made:

Wizard	lb2a
Enable I/O config Visualize Wizard	: YES
report?	NO
(Push [DOWN] to continue)	

If the settings are correct, the set values can be installed:

Wi zard	lb3a
Boards nece	essary
· · · ·	<u> </u>
AII boards (ENTER) to	present, continue

After waiting a few seconds, the unit can be started.

Wizard
Successfully complete
Press (ENTER) to continue

Note: after having configured pRack pR300, the device needs to be switched off and on again to permanently save the new data.
